**APPROXIMATE ANNUAL WATER BUDGETS OF TWO CHAINED PINYON-JUNIPER SITES,**
Utah State Univ., Logan. Watershed Science Unit.
G. S. Gifford.
Journal of Range Management, Vol 28, No 1, p 73-74, January 1975. 1 tab, 5 ref.

Descriptors: *Water balance, *Runoff, *Interception, *Vegetation effects, Soil moisture, Pinyon pine trees, Juniper trees, *Utah, Rainfall, Semiarid climates, Precipitation, Seepage, Hydrologic budget.
Identifiers: Chaining.

Two chained pinyon-juniper sites in Utah were studied to obtain an approximate water balance for each of these treatments at each site: natural woodland, chaining-with-debris-in-place, and chaining-with windrowing. Results indicate that most of the annual precipitation falling on each treatment is lost through evapotranspiration, with much of the remainder being lost through interception. When runoff did occur, it was greatest from the windrowed treatments and least from the debris-in-place treatments. The range of annual rainfall for the two sites was about 8 to 11.5 inches. Deep seepage was zero in all cases. (Mastic-Arizona)

In: Proceedings of Symposium on the Design of Water Resources Projects with Inadequate Data, Volume 1; Madrid, June 1973. sponsored by UNESCO-WMO-IAHS: Comite Espanol para el D H I, p 435-442, 1973. 9 tab, 1 ref.

Descriptors: *Probability, *Monte Carlo method, *Flood frequency, Simulation analysis, Statistical models, Decision making, Flood control

Monte Carlo simulations were used to assess flood and overdesign losses that result from differing choices of assumed frequency distribution, plotting position, criterion of best fit and length of record. The probability of the event that a sequence, having a particular element of the real world set as its underlying distribution, is best fitted by a particular element of imagined world set, relative to a particular method of assigning exceedance probabilities and a particular criterion of best fit, was estimated by N/18,000, where N denotes the number of times the event occurred and 18,000, the total number of times the event could have occurred. Identifiers: *Santa Fe County(N Mex), Pojoaque River basin(N Mex).

The natural flow is computed for the Pojoaque River at several points along its course in Santa Fe County, N. Mex., on a monthly basis for the period 1935-72. The recorded flow is tabulated for the Rio Grande at Otowi gaging station on a monthly basis for the period 1935-72. Computations were made to determine the volume of groundwater that could be withdrawn from the Pojoaque River drainage basin, assuming drainage of the aquifer was to depths of 500, 1,000, and 1,500 feet. The results indicate that 3,300,000 acre-feet of water could be withdrawn by draining the aquifer to a depth of 500 feet; 9,500,000 by draining the aquifer to a depth of 1,000 feet; and 14,900,000 by draining the aquifer to a depth of 1,500 feet. aborative university-industry research pro-
being conducted for the introduction of an
computer control system for a water supply
k in the United Kingdom. Aspects of the
n of water distribution include modelling
nulation, consumption forecasting, waste
on, and optimal control. Each can be con-
as a set of interacting subproblems, within
control effort is subdivided into a hierarchy
rol function of ascending complexity. The
provides a framework for overall control
network including optimal pumping control,
erm demand forecasting and anomalous-
tection, each to be performed online on a
computer and implemented at the plant by
etry scheme. Details of each layer of con-
described and proposed implementation via
computers is discussed. The multilayer con-
f control includes control activities as-
d with a regulator layer, an optimizing
an adaptive layer to compensate for
ances or model induced errors, and a self-
ing control function, which gives feedback
control-system design. (Prague-FIRL)

A technique was developed for determining daily values of snowmelt runoff efficiencies (i.e., the portion of a snowpack that is converted into recoverable water) from small forested watersheds by coupling a computer program that stimulates Arizona snowmelt processes with graphical procedures of runoff hydrograph separation. Employing this technique, seven watersheds with 14 years of record were used in evaluating changing patterns of snowmelt runoff efficiences within a year. Additionally, an array of physical, biological, and climatic variables were empirically correlated with snowmelt runoff efficiencies to identify the factors affecting efficiencies both within and among snowmelt-runoff seasons. Inventory-prediction equations were also formulated for use in the stratification of high water-yielding watershed source areas.

Descriptors: *Irrigation, *Water management(Applied), *Canals, *Colorado, Land resources, Land use, Water balance, Water rights, Rehabilitation, Consolidation, Irrigation canals, Canal linings, Canal seepage, Hydraulic structures, Agriculture, Urbanization, Water distribution(Applied), Water supply, Water shortage, Water transfer.
Identifiers: *Poudre Valley(Col).

The advantages and disadvantages of consolidating certain canals south of Cache la Poudre River were explored. Field investigations were reported regarding the rehabilitation of canals and laterals north of the Cache la Poudre River. The engineering costs and expected water savings of such improvements were explored. The land served by the canals on the south-side of the Cache la Poudre River are rapidly being developed. As land is taken out of production, the irrigation water for that land is sold out of the canal and to the city. This causes a greater percentage of the remaining water in the canal to be lost to seepage. The only feasible canal consolidation proposal for the south-side canals is to consolidate all four canals into the Pleasant Valley and Lake Canal. The only feasible canal lining program would appear to be the high seepage loss sections in the North Poudre Canal and Larimer County Canal. Lining the entire length of the North Poudre Canal would alleviate present water shortages in that system except for a few dry years. (Sims-ISWS)

**COULD THE SEA BE USED TO STORE WATER FOR SUPPLY.--A POSSIBLE SCHEME,**
G. H. Mortimer.
Water Services, Vol 29, No 949, p 98-103, March 1975. 6 fig, 1 tab, 5 ref.

Descriptors: *Reservoirs, *Reservoir sites, *Water storage, Reservoir storage, *Water supply, Storage capacity, Routing, Dependable supply.
Identifiers: *Underseas water storage.

Due to the objections of an environmentally conscious public to the construction of large inland water reservoirs, a water storage scheme is proposed which may resolve this problem and could also make more efficient use of the rivers as sources of water supply. This system involves taking water from a river above the tidal limit and pumping it to a flow balancing tank located on the coast. Two pipes are connected into this tank, one carrying water to a supply and the other leading to the flexible bags situated on the seabed a few miles offshore. The works have been divided into three parts: works at the river abstraction point (including the initial water treatment); the flow balancing tank; and, the bags. The advantages of an underseas storage scheme include: since no countryside is lost through flooding, undersea storage should be more readily acceptable to the general public; it allows a more efficient use of rivers as sources of water supply than at present; some degree of economic flexibility is inherent since by adding more bags to the system the yield can be increased to meet demand; and there are a large number of possible sites around the coastline of Great Britain conveniently close to cities such as Teesside, Newcastle, London, and Hull. The main disadvantage is that underwater storage has a greater chance of an accident occurring which will cause a failure of supply than does inland storage. (Orr-FIRL)

Identifiers: *Jebel Marra Area(Sudan), *Sudan.

This report described the first phase of a project under the United Nations Development Programme to assist the Government of the Sudan to obtain technical data on which to base plans for the agricultural development of the Jebel Marra and Wadi Azum areas of the Darfur province. The Government's policy is to broaden the basis of the national economy by geographical dispersal of development activities and crop diversification in agricultural areas. Field operations were carried out from 1963 to 1967. An inventory of basic land and water resources was made and economic studies were carried out. The scope of the introducing more advanced agricultural techniques was examined, together with the social and economic factors involved. The foundation for a follow-up project to support experimental agricultural development was laid. It was recommended that the project be continued with a shift in emphasis from a survey of resources to agricultural development demonstration. The main emphasis should be placed on the production of high gross-value crops which are particularly adapted to the climate and soils of the project area, and which either have to be imported or are only seasonally available. The theme of the report would be extension work among the farmers, to introduce better cultural practices and varieties of crops, and the use of fertilizers and irrigation water. Since pumping from the underground waters of the terrace lands of the Wadi Azum provides the major irrigation possibilities, increased attention should be given to pilot stations and farmer demonstrations of irrigated crops there. Identifiers: Rainfall-runoff data, Model evaluation, Drainage design techniques.

A comprehensive report dealt with urban hydrology in Australia. Existing sources of urban rainfall-runoff data in Australia were examined in considerable detail. Specific basins were examined and the kinds of available data were discussed. The Rational Method, the Road Research Laboratory Method, the Modified Road Research Laboratory Method, and Laurenson's Runoff Routing Model were described and evaluated. An earlier evaluation of 8 other mathematical simulation models was summarized and these models compared. Consideration was given to water quality aspects of urban drainage and the types of quality data available. (Terstriep-ISWS)

Identifiers: *Minimum-route method, Least-cost, Pipe diameter, Connecting pipe, Transportation theory, Branched pattern, Gridiron pattern.

When designing a workable water-distribution network, three conditions should be considered: water-pressure distribution, flow distribution, and engineering economy. Any attempt to improve the design of a network primarily constitutes determining the pipe diameters that minimize total network construction cost while meeting hydraulic requirements. Described is a simple procedure to design an improved water-distribution network using market-ready pipe, applying minimum-route network-planning techniques. Considered is a network of fixed pipe routes, as a pipe network is governed mainly by the network of streets. An improved network is assumed whereby the allowable minimum hydraulic head is maintained at all outlets while minimizing construction costs of the network. Minimum routes to all outlets are selected and designed for market-ready pipe sizes that satisfy the theoretical, economical hydraulic gradient. An example network of a city is simplified to eliminate junctions for which the number of pipes entering the junction is fewer than three. For a basic branching system, use of the minimum route technique produces an economical pipe diameter of standard market size on the basis of most economical theoretical hydraulic gradient along each minimum route. Piping cost is 18.7% less using this method than with conventional method. (Bell-Cornell)

ers: Macroscopic model, Operating data, Head drop.

ed is a derivation of a regression algorithm ed previously by Gilman et al as an alter- conventional means for modeling waterion systems. The statistical model ed herein is macroscopic, as it deals only jor heads and flows associated with pumps ks. Given are the drawbacks of using a opic, or full network, model for purposes rol. The macroscopic model, designed to ne these limitations, has great speed of solution and accuracy and is kept very up-to-date; it obtains its parameters from continual analysis of operating data, obtains the major heads and flows by a noniterative process, and functions without takeoff assumptions. The model has been developed for a system having only partial information available because of the stochastic nature of customer demand and the constant change in hydraulic network characteristics. The validation procedure shows that the macroscopic model is able to reproduce actual operating data accurately in a two-pump station, two-tank distribution system. It is found to be the exact equivalent of a full network model subjected to proportional loads in a day-long simulation. However, since the accuracy of the macroscopic model will decrease in a district having large nonproportional industrial loads, a full network model should replicate such a district better. (Bell-Cornell)

**FINITE-ELEMENT METHOD FOR WATER-DISTRIBUTION NETWORKS,**
AC1 Environics, Melbourne (Australia).
A. G. Collins, and R. L. Johnson.
Journal of the American Water Works Association, Vol 67, No 7, p 385-389, July 1975. 5 fig, 34 equ, 14 ref.

Descriptors: *Water distribution(Applied), *Networks, *Finite element analysis, *Pipes, Equations, Algorithms, Numerical analysis, Structural analysis, Pipe flow, Head loss, Hydraulics, Computer programs, Temperature, Effects, Hazen-Williams equation, Systems analysis, Methodology, *Distribution systems.
Identifiers: Hardy Cross method.

The finite-element method has been increasingly used in a variety of engineering fields, including structural analysis. The equivalence of structural systems and pipe networks has long been recognized. The specific pipe-network problem may be defined using the finite-element approach, but since the system of equations for structural problems is normally linear, actual solution is difficult due to the nonlinear constitutive equations relating the flow and head loss. Herein, a computational algorithm derives the unique solution for an easily solved linear system equivalent to the true nonlinear system for pipe networks. The successful application of the finite-element method to pipe-network problems shows that the method is not only superior to conventional Hardy Cross techniques, but that further advantages of complete network representation, simplified input data, and unlimited network size can be obtained. The major advantage of the method is its speed of convergence and lack of convergence problems. The program developed allows for solution by either the Hazen-Williams or the Darcy-Weisbach flow-head-loss relationships, and it can consider the effect of temperature variations on head loss throughout the network. GENFEM, a general, very efficient finite-element program, is easily adapted for the pipe-network problem. The mathematical basis and applications of this methodology are described in detail to allow easy adaptation of other finite-element programs for solving water-distribution--network problems. J. C. Hudson.
In: Proceedings, Research Planning Conference on Integrated Systems of Aquatic Plant Control, October 29-30, 1973, Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, p 25-27, August 1974.

Descriptors: *Aquatic weed control, *Research and development, *Florida, Financing, State governments, Participating funds, Water hyacinth.
Identifiers: Elodea, Water milfoil.

The Florida Department of Natural Resources is responsible for coordinating research and control of noxious aquatic plants at an annual expenditure of $2.8 million. Water hyacinth, Florida elodea, and Eurasian water milfoil are the most important, with elodea the major pest. Research efforts involve biological, chemical, and mechanical control methods, such as foreign exploration and introduction of insects and pathogens, botanical and ecological aspects of control, integrated chemical and biological techniques, utilization studies, ditchbank grass control, analysis of herbicides, and literature reviews. Results with mechanical harvesters to control water hyacinths in St. Johns River have not been encouraging. Use of white amur in conjunction with herbicides; establishment and effectiveness of the water hyacinth weevil; and use of foams, inverts, slow-release formulations, and new herbicides are being studied. Increased effectiveness and efficiency are needed, while decreasing drift and herbicide concentration. Airboats and an aircraft with a microfoil boom treated 35,000 acres during 1972-1973. Botanists help establish aquatic plant control programs, update control procedures, and monitor the Aquatic Plant Control Permit System. Training sessions for applicators were planned and new regulations on importation, cultivation, and transportation implemented. Matching state funds are available to local agencies for aquatic plant control. (See also W75-08289) (Buchanan-Davidson--Wisconsin)

In: Proceedings, Research Planning Conference on Integrated Systems of Aquatic Plant Control, October 29-30, 1973, Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, p 75-83, August 1974. 1 tab, 8 ref.

Descriptors: *Biocontrol, *Aquatic weed control, Plant ecology, Plant growth, Life cycles, Distribution, Foreign research, Insects, Hosts.
Identifiers: *Eurasian water milfoil, Lepidoptera, Coleoptera, Homoptera, Parapoynx stratiotata, Litodactylus leucogaster.

Eurasian water milfoil, an introduced perennial submersed weed, has reached pest proportions by infesting thousands of acres in Chesapeake Bay, in Tennessee reservoirs, and in Florida and Georgia lakes and river basins by restricting water usage and decreasing property values. It grows under a wide range of conditions and forms a smothering blanket that crowds out other vegetation. Its ecology, growth habits, and life cycle are reviewed. Studies in the United States, Yugoslavia, and Pakistan have uncovered a number of biotic agents that show potential for controlling this plant. Twelve Lepidoptera, ten Coleoptera, one Diptera, and three Homoptera have been associated with Eurasian water milfoil. Many of the species are polyphytophagous and cannot be imported into the United States, but the associations demonstrate that the weed is a suitable host for insects belonging to several orders. At present control in the United States is limited to the use of herbicides and some cultural methods such as water management. One insect species, Parapoynx stratiotata, shows a potential for reducing vegetative reproduction. Litodactylus leucogaster may reduce seed production. Further testing under United States quarantine will be needed to determine which species could be imported for release in North America. (See also W75-08289) (Buchanan-Davidson--Wisconsin)

In: Proceedings, Research Planning Conference on Integrated Systems of Aquatic Plant Control, October 29-30, 1973, Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, p 103-106, August 1974.

Descriptors: *Marine plants, *Submerged plants, *Grasses, *Planting management, Spoil banks, Silting, Salinity, Mississippi, Bottom sediments, Estuaries, Slopes, Methodology, Turbidity.
Identifiers: *Sea grass, *Transplantation, Diplanthera wrightii.

The establishment of submerged plants by transplantation on spoil or other barren bottom areas in marine or estuarine systems is described. Effective anchors to moor the transplants covered with 20 feet or more of water were devised. Transplanting to barren bottom areas was possible within limits. The 'best' species, based on survival and extremely rapid growth, was Diplanthera wrightii. No appreciable differences in nutrient levels between vegetated and barren areas existed. Successful transplants were made in early spring and summer following mild winter temperatures or in summer following a severe winter, but low winter temperatures killed fall and winter transplants. Prolonged exposure to low salinity (5 parts per thousand or less) was detrimental. Sedimentation rates exceeding three inches per month also caused death. Spoil banks with steep slopes and spill areas where the substratum was being constantly reworked were unsuitable for transplantation due to erosive forces of waves and currents. Highly turbid water in near-shore areas also restricted plant growth. Sometimes eroded emergent spoil covered submerged spoil and killed the transplants. Descriptors: *Transportation, *Application equipment, *Aquatic weed control, Application methods, Spraying, Barges, Boats, Irradiation.
Identifiers: Laser transport, Archimedes' screw vehicles, Riverine utility craft, Screw propulsion vehicles.

High-mobility operations platforms for herbicide sprayings and laser irradiation of aquatic weeds must be able to move freely in weed-infested waterways with reasonable speeds, have good control, be usable in unfavorable weather, be reliable, economical, and be readily transportable over normal roads between sites. A vehicle running on buoyant Archimedes' screws may be the most suitable. Compared to boats and wheel and tracked vehicles, the two screw vehicles (t marsh screw and the Riverine Utility craft) n well in water, better in marsh areas, but poorly firm soil. The marsh screw is more suitable spray application than the Riverine Utility cra Screw vehicles are one to ten times more effect than small boats or barges used as support vehic for herbicide applications with comparatively lit added cost. The laser system is too heavy for present equipment, except barges, but the scr propulsion principle would be useful for the app cation of herbicide sprays and biological cont organisms in inaccessible areas and as an ancill vehicle for mechanical treatments. Descriptors: *Aquatic weed cont *Methodology, Herbicides, Biocontrol, Chemc trol, Algal control, Grasses, Floating plants, S merged plants, Canals, Irrigation ditch Mechanical control, Harvesting, Vegetati Rates of application, Application methods.
Identifiers: Emersed weeds, Broadleaved plant

Registration of aquatic herbicides is imperative their use in vegetation management. Forms of noxious aquatic vegetation can be algae or vas lar aquatic plants such as floating, submers emersed, and marginal plants. Agriculture, rec tion, property values, wildlife and fishe management, potable water supplies, and nav tion are affected by aquatic vegetation. Cop sulfate, dichlone, dichlobenil, acrolein, arom solvent, diquat, and endothall are used to mar algae; and 2,4-D, silvex, and diquat control fl ing weeds. To control submersed weeds, acrol aromatic solvent, copper sulfate, diquat, dothall, monuron or diuron can be used in irr tion canals and ditches; acrolein, aromatic solv and copper sulfate in drainage ditches; dichlobenil, diquat, endothall, fenac, 2,4-D, vex, and sometimes acrolein, aromatic solv simazine, and diuron can be applied in la ponds, and reservoirs. Emersed and marg weeds can be treated with 2,4-D or silvex grass and grasslike species with dalapon, 2,4-D monosodium methanearsenate and trichloroac acid. Mechanical control devices, biocon (such as fish, snails, crayfish, insects, pathog and competitive vegetation), and ecolo modifications can be used. The advantages disadvantages of chemical methods are discus (See also W75-08289) (Buchanan-David Wisconsin)

**HYDROGEOLOGY AND WATER RESOURCES OF MIDDLE KIRKLAND CREEK BASIN, YAVAPAI COUNTY, ARIZONA,**
Arizona Univ., Tucson. Dept. of Hydrology and Water Resources.
J. H. Randall.
Arizona University, Tucson, Department of Hydrology and Water Resources. MS Thesis, 1974. 57 p, 10 fig, 6 tab, append, 22 ref.

Descriptors: *Hydrogeology, *Aquifers, *Aquifer characteristics, *Sediments, *Basalts, *Alluvial aquifiers, *Arizona, Groundwater, Structural geology, Alluvium, Soil types, Conglomerate rocks, Water yield, Zone of saturation, Flood plains, Soil mechanics.
Identifiers: *Kirkland Creek(Ariz), *Yavapai County(Ariz).

Middle Kirkland Creek basin lies at the northern edge of the basin and range province 20 miles southwest of Prescott, Arizona. The hydrogeologic system of the basin includes two major aquifers, alluvial sediments and basaltic volcanics. The alluvial sediments are a series of granitic pebble conglomerates intercalated with basalt flows in some areas overlaid by fine-grained lacustrine sediments that grade laterally into a pebble conglomerate. Overlying this unit is a thin narrow deposit of unconsolidated sands, gravels, and silts representing the flood-plain alluvium. The basalt aquifer consists of a series of more than 1000 feet of fractured basalt flows interbedded with cinder and conglomeratic layers. The water production potential of the basaltic units in the central portion of the basin is unknown. However, the survey indicates that the hydrogeologic system allows a thick zone of saturation storing large quantities of water. Wells drilled in the Kirkland gorge could have an estimated yield of 200 to 1000 gpm. (McLacklan-Arizona)

**DEPRIVATION CONTRIBUTION AND INTERFERENCE EFFECTS OF MULTIPLE WELLS IN A COMMON AQUIFER,**
Oklahoma Univ., Norman. Dept. of Civil Engineering and Environmental Science.
J. F. Harp, and J. G. Laguros.
Ground Water, Vol 13, No 3, p 251-253, May-June 1975. 1 fig, 1 tab.

Descriptors: *Groundwater, *Aquifers, *Management, *Groundwater mining, *Pumping, Overdraft, Water wells, Groundwater resources, Water supply, Drawdown, Water table, Distance, Equilibrium.
Identifiers: *Depleted aquifer, *Interference effects, *Depletion effects, Multiple wells, Deprivation.

A method of assessing groundwater interference effects of multiple wells upon any given well in an aquifer was presented. The method specifically related to depleted aquifers and attempted to assign the responsibility for the depletion effects to all users on a reliable basis. This basis entails the fundamental relationships between the pertinent variables and is not a simple percentage of water usage rates. The method took into account both flow magnitude and radial distances from all users to the given depleted account both flow magnitude and radial distances from all users to the given depleted well. Large flows at longer distances, in general, affected a given well less than smaller flows at closer distances. The methodology applied was developed as a result of a legal suit where relative responsibility among several users for depletion effects had to be assigned. The method assigned the effects, or deprivation contribution, of all water users on any given well in an aquifer common to all the wells. The limitations of the method were also discussed. **APPROXIMATION FOR STEADY INTERFACE BENEATH A WELL PUMPING FRESH WATER OVERLYING SALT WATER,**
New Mexico Inst. of Mining and Technology, Socorro.
R. G. Haubold.
Ground Water, Vol 13, No 3, p 254-259, May-June, 1975. 3 fig, 1 tab, 12 ref.

Descriptors: *Saline water intrusion, *Saline water-fresh water interfaces, *Mathematical models, *Estimating equation, Percolation, Seepage, Interfaces.
Identifiers: *Hele-Shaw model, *Muskat flow through porous media.

The computation of the shape of the interface between fresh water pumped from a well and the salt water beneath it was based on an empirically derived modification of Muskat's approximation for the height of the cone beneath a well. Differing depths of well penetrations and their effect on the upconed interface were investigated with the approximation. The computed interfaces (actually transition zones) were compared with corresponding interfaces determined experimentally in a Hele-Shaw model. Alteration of the length of the production zone of a well at a constant pumping rate did not influence the shape or position of the interface significantly. Though the approximation fits closely with the model, it should be refined further. (Bradbeer-NWWA)

C. Wu.
In: International Symposium on Development of Ground Water, November 26-29, 1973, Madras, India, Vol 1, p IIB 17-28 (1973). 9 fig, 1 tab, 3 ref.

Descriptors: *Land subsidence, *Groundwater, *Artesian aquifers, *Clays, Fluid withdrawal, Potentiometric level, Compressibility, Head loss, Instrumentation.
Identifiers: Clay stringers, Pieziometric decline, *Taiwan(Taipei basin).

Releveling of bench marks in 1971 and 1973 indicates that land subsidence of the ground surface in the Taipei Basin has exceeded 1.8 meters since 1957. In the sharp subsidence area, subsidence which was about 0.6 meters in 1966 has doubled. The maximum rate of subsidence in recent years has been about 25 cm per year. As a result of accelerated urbanization of the Basin area, most of the modern ground water development has occurred since 1957. The annual pumpage was 8.9 million cubic meters, 328 million cubic meters, and 435 million cubic meters for 1957, 1964, and 1969, respectively. As a result of an imposition of strict controls, the extracted water was reduced to 24 million cubic meters in 1972. Plots of subsidence versus decline in artesian pressure suggest that pressure decline is a major cause of the subsidence. Consolidation data are used to verify the relationship. However, other causes such as compaction of soil, tectonic adjustment, and loading of the land surface may have contributed to the subsidence. (Bradbeer-NWWA)

Identifiers: *Energy development.

Generally, the Colorado river flow is divided among users on the basis of beneficial consumptive use. New societal demands for water along with large economic forces to exploit fossil fuels in the Colorado river basin are causing profound changes in the basin. Claims for greater shares of the flow are being made by Indians, recreationists, environmentalists, supporters of fish and wildlife, and commercial mining interests. The flexibility of the law of the river pertaining to energy development, water demand, and competing forces is discussed. (Robinett-Arizona)

## 4D. Watershed Protection

SHRUB TRANSPLANTING FOR WATERSHED MANAGEMENT AND RANGE IMPROVEMENT IN IRAN,
Arizona Univ., Tucson. Dept. of Watershed Management.
N. Nemati.
Arizona University, Tucson, Department of Watershed Management, MS Thesis, 1974. 52 p, 21 fig, 4 tab, 18 ref.

Descriptors: *Watershed management, *Erosion control, *Arid climates, *Shrubs, Erosion, Vegetation, Precipitation, Moisture deficit, Revegetation, Humidity, Evaporation, Range management.

Identifiers: *Iran, Atriplex canescens(Fourwing saltbush).

The central plateau of Iran is virtually void of plant growth due to cold winters, hot summers, low precipitation, low atmospheric humidity, and high evaporation. Transplanting shrub species has been shown to be one possible way to revegetate these rangelands. Fourwing saltbush (Atriplex canescens) was the most adaptable of the three saltbushes tested for growth in nurseries in plastic bags and transplanted in the central plateau of Iran. Their adaptability to the harsh climate will help restore the watershed, provide effective erosion control, and generally improve the vegetation. (McLachlan-Arizona)

Descriptors: *Soil stabilization, *Semiarid climates, *Southwest U.S., *Vegetation establishment, Rehabilitation, Density, Watershed management.
Identifiers: Fourwing saltbush, Alkali sacaton.

The harsh climatic extremes of the semiarid Southwest make it difficult and often impossible to establish plants for soil stabilization. A 20 year watershed rehabilitation project concentrated on the establishment of two plants native to the area - fourwing saltbush (Atriplex canescens (Pursh) Nutt.) and alkali sacaton (Sporobolus airoides (Torr.) Torr.). A step-by-step planting guide is presented for each plant including growing transplants and field planting procedures. Information is also provided to determine those areas that are suitable for plant establishment and the amount of cover and stabilization that may be expected. (Mastic-Arizona)

Rehabilitation procedures should be site specific. They must be implemented by those familiar with the ecological sturucture and successional responses characteristic of the site to be reclaimed. Factors to be considered in reclamation efforts are physical and chemical properties of the soils, degree of slope and exposure, dominant plant species present before the disturbance, and the area's climatic variability. Moisture is the limiting factor in successful rehabilitation of lands disturbed by mining and exploration for coal, oil shale, and uranium in the western states. Most areas of the West are difficult to reclaim because precipitation is not only low but the occurrences are also erratic and unpredictable. In most desert areas natural plant regeneration takes place only every five to seven years when two or more successive favorable moisture years occur. Therefore, they are subject to great stress from intermittent precipitation, extremely low and high temperatures, strong winds, and excessive evaporation. This study offers guidelines to aid reclamation efforst in the difficult western region. (Bowden-Arizona)

Identifiers: Artemisia tridentata

Watershed management for big sagebrush rangelands is discussed. Climate, soils, vegetation, snow accumulation, and water yields are described, followed by a review and discussion of how management practices alter vegetative composition and the hydrologic regime. Potential hydrologic benefits from managing blowing snow in the big sagebrush type are outlined, and research needs are highlighted. (Witt-IPC)

S. V. Thomson, and R. M. Allen.
Progressive Agriculture in Arizona, Vol 27, p 8-9, May-June, 1975. 2 fig, 11 ref.

Descriptors: *Recycling, *Citrus fruits, *Irrigation water, *Spores, *Fungi, *Pollutant identification, *Arizona, Return flow, Water reuse, Hydrology, Tailwater, Epiphytology.
Identifiers: *Phytophthora.

A study was made of the effect of irrigation flow to citrus orchards in the vicinity of Phoenix, Arizona, when this recycled water carried spores of the parasitic fungi Phytophthora. The presence of zoospores in water recycled to the crop and from which it was collected posed a serious threat for several reasons, including the danger of infection to clean orchards; the pathogenicity of species of Phytophthora, particularly since they are well adapted to an aquatic environment.

ct possible with tree trunks during flood ir-
on. Water from 20 sites in citrus groves was
ed over a period of a year from the tailends
rigation ditches, 9 sumps, recycled water at
ad-ends of 4 irrigation ditches, and project
at 2 canal locations. The method of
sing the samples is given. Phytophthora spp.
solated in 93 of 599 samples, and with one
ion, all were identified as present in waste
from citrus orchards. Well-water, initially
ely free from fungi, was heavily con-
ted after passage through a citrus orchard
r cropped acreage. Infection is more likely
s tree trunks from flood irrigation by recy-
ater contaminated with Phytophthora spp.

ADVANCES IN THE DETECTION OF WATER POLLUTANTS,
Canada Centre for Inland Waters, Burlington (Ontario).
S. Barabas.
Chemistry in Canada, Vol 27, No 6, p 26-29, June 1975. 45 ref.

Descriptors: *Analytical techniques, *Reviews, *Pollutant identification, Organic matter, Municipal wastes, Industrial wastes, Spectrophotometry, Gas chromatography, Mass spectroscopy, Remote sensing, Phenols.
Identifiers: Coprostanol, Cholesterol, Voltammetry.

A review of analytical methodology of water for the Canada Centre for Inland Waters (CCIW) from December 1973 to November 1974 is given. All research of the CCIW is done as a response to needs of a federal regional laboratory, a research component of the CCIW, or an international organization in which Canada is actively collaborating. Progress in chromatography/mass spectrometry included the methodology for analyzing organochlorinated pesticides, dithiocarbamates, and 1,4-oxathiins as well as a number of industrial pollutants. Methods were gas chromatography, high pressure liquid chromatography, thin-layer chromatography, GC/MS, NMR, and infrared. The analysis of organic pollutants (phenols, formaldehyde), inorganic pollutants (chlorides, arsenic, antimony, selenium), and detergents (phosphate, citric acid) has also been developed. Methods were spectrophotometry, of the types UV, visible, molecular fluorescence, IR, and atomic absorption. Publications have been made under electro-analytical methodology, involving activities in the area of applying selective ion electrodes to multi-element analysis. Other related developments were in voltammetric applications. Biological analysis utilized coprostanol and cholesterol as indicators of excretal pollution in sewage and industrial treatment. Radiochemistry, electron microscopy, and remote sensing studies were also discussed. (Prague-FIRL)

RETENTION OF CADMIUM IN MICE STUDIED BY WHOLE BODY AUTORADIOGRAPHY,
National Inst. of Radiological Sciences, Chiba (Japan). Div. of Training Schools.
H. Shibata.
J Radiat Res, Vol 15, No 2, p 107-110. 1974. Illus.

Descriptors: *Cadmium, *Pollutant identifications, *Rodents, Absorption.
Identifiers: Mice, *Radiography.

The time-course of distribution of Cd (an environmental pollutant) in mice was investigated for up to 180 days after administration of 109Cd by whole body autoradiography and by radioactivity counting. Very little accumulated 109Cd was excreted from the body; it remained mainly in liver, kidneys and pancreas for a long time. The pattern of retention of 109Cd varied with organs: in liver, gastrointestinal wall and salivary glands, the concentration of 109Cd decreased with time in pancreas, spleen and lungs, it decreased very little; in kidneys, it increased. Liver retained a larger amount of 109Cd than any other organ even after a long period. In kidneys, most of 109Cd was retained in the cortex.--Copyright 1974, Biological Abstracts, Inc.

PATHOGENIC FREE-LIVING AMOEBAE IN ARKANSAS RECREATIONAL WATERS,
Arkansas Univ., Fayetteville. Dept. of Zoology.
L. W. Bone, and D. A. Becker.
Available from the National Technical Information Service, Springfield, Va. 22161. as PB-244 709, $3.25 in paper copy, $2.25 in microfiche. Arkansas Water Resources Research Center, Fayetteville, Completion Report, 1975. 9 p, 1 tab, 11 ref. OWRT A-028-ARK(1), 14-31-0001-5004.

Descriptors: *Arkansas, *Recreation, Animal populations, Water quality, Animal pathology, Cultures, *Pollutant identification, *Pathogenic bacteria, Isolation, Human diseases.
Identifiers: *Pathogenic anoebic, Limax, *Amoebae population density, Species diversity, Pathogenic strains(Amoebae).

Selected recreational waters of Arkansas were sampled for pathogenic free-living limax amoebae. Water quality parameters were determined for correlation with amoebic population densities and species diversity. Cultural criteria and animal inoculation revealed no pathogenic strains. The feasibility of introduction and/or induction of pathogenic amoebic strains by environmental factors necessitates further ecological investigations.

DEVICE FOR AUTOMATIC DETERMINATION OF SUSPENDED SOLIDS CONTENT IN WATER,
Agency of Industrial Science and Technology, Tokyo (Japan). (assignee)
H. Sunahara, Y. Ishihara, and N. Nakayama.
U.S. Patent No 3,893,333, 6 p, 6 fig, 1 tab, 2 ref; Official Gazette of the United States Patent Office, Vol 936, No 2, p 469, July 8, 1975.

## Group 5A—Identification Of Pollutants

Descriptors: *Patents, Water quality, *Water quality control, *Water pollution control, Water purification, *Suspended solids, Sampling, Automation, Measurement, *Pollutant identification.

The device for the automatic determination of the suspended solids content of water comprises a sample liquid collection unit, a specimen preparation unit, a filter paper feeding unit, a filter paper transfer unit, a suspended solids filtration unit, a drying unit, a weighing and display unit and a process control unit. All processes are automatic. All steps of operation are carried out by having relevant mechanisms automatically actuated by means of the timer of the automatic process control unit. Thus, the determination can be performed accurately and rapidly. Further, absence of manual operation serves to eliminate human error and ensures perfectly reliable determination. (Sinha-OEIS)

Descriptors: *Lakes, *Remote sensing, *Aerial photography, *Reflectance, Lake Ontario, Upwelling, Thermal properties, Circulation, Mass transfer.
Identifiers: *Sun-glint.

Features demarcated by mirror-reflected solar illumination (sun-glint) in aerial photographs of Lake Ontario and the role of sun-glint in evaluating the nature of dynamic processes occurring within the lake which display surficial characteristics is described. Under sun-glint conditions visible and infra-red photography may delineate dynamic interfaces between thermally different water masses. A time-sequential series should enable quantitative estimates of the nature of dynamic processes to be made. Sun-glint usage requires modification of surface solar reflective properties by lake dynamics. Imagery of upwelling areas indicated that surficial glitter patterns are induced when spatial variations of thermal time-gradients change. Such conditions are present in onset and decay phases of upwelling. Sun-glint discerned dynamics of river mouth thermal effluent injections, surface slicks, coastal mass transport, and lake circulation patterns if conditions were not in a dynamic equilibrium state. Sun-glint was used to evaluate the dynamics of the June 7, 1972 upwelling off the north shore of Lake Ontario. Using aerial photography and ground-truth data, it was concluded that spatial and temporal changes in thermal time-gradient are required to produce surface features discernable in sun-glint. **SOME OBSERVATIONS CONCERNING PREPARATION AND STORAGE OF STREAM SAMPLES FOR DISSOLVED INORGANIC PHOSPHATE ANALYSIS,**
Cornell Univ., Ithaca, N.Y. Dept. of Agronomy.
A. H. Johnson, D. R. Bouldin, and G. W. Hergert.
Water Resources Research, Vol 11, No 4, p 559-562, August, 1975. 3 fig, 9 ref, 4 tab.

Descriptors: *Water analysis, *Phosphates, *Storage, Time, Inorganic compounds, Analytical techniques, Water pollution sources, Trace elements, Water pollution, Phosphorus compounds, Water properties, Freezing, Refrigeration, Pollution identification, New York.
Identifiers: Fall Creek(NY).

The influence of storage conditions and duration of storage was studied by using about 100 stream samples from Fall Creek collected near Ithaca, New York. Freezing and refrigerated storage were unsatisfactory, since changes in measured concentrations were usually observed after relatively short periods of time (24 hr). An isobutanol extraction procedure is described which minimizes storage problems and is useful for routine analysis of water samples for dissolved inorganic phosphate. (Witt-IPC)

**INTERFERENCE OF MERCURY(II) IN THE COLORIMETRIC DETERMINATION OF INORGANIC PHOSPHATE IN WATER,**
Massey Univ., Palmerston North (New Zealand).
R. W. Tillman, and J. K. Syers.
The Analyst, Vol 100, No 1190, p 322-324, May, 1975. 7 ref, 2 tab.

Descriptors: *Water analysis, *Phosphates, *Mercury, *Colorimetry, Inorganic compounds, *Analytical techniques, Chemical analysis, Water pollution sources, Trace elements, Water pollution, Chemical precipitation, Phosphorus compounds, Water chemistry, Water properties, Water quality, *Pollutant identification.

Mercury(II) caused a significant positive interference in the colorimetric determination of inorganic phosphate in the range 0-0.080 microgram/liter by the procedure of Murphy and Riley. The interference resulted from the formation of a precipitate that varied in particle size and was not always visible to the naked eye. With higher levels of inorganic phosphate (0.800 microgram/liter) a coarse precipitate formed that partially removed the molybdophosphate complex ion from solution. Elimination of this interference was achieved by complexing the mercury(II) with chloride or thiosulfate. (Witt-IPC)

**MODIFICATION OF THE IODIMETRIC TITRATION METHOD FOR THE DETERMINATION OF BROMIDE AND ITS APPLICATION TO MIXED DOMESTIC-INDUSTRIAL WASTE EFFLUENTS,**
National Environmental Research Center, Cincinnati, Ohio. Methods Developments and Quality Assurance Research Lab.

## Group 5A—Identification Of Pollutants

D. F. Bender.
The Analyst, Vol 100, No 1191, p 400-404, June, 1975. 5 ref, 2 tab.

Descriptors: *Waste water(Pollution), *Water analysis, *Volumetric analysis, *Bromides, *Analytical techniques, Chemical analysis, Water pollution sources, Hydorgen ion concentration, Instrumentation, Municipal wastes, Industrial wastes, Wastes, Iodides, Halogens, *Pollutant identification.

The iodimetric titration method for the determination of bromide involves the observation of various color changes, making the method unsuitable for use with samples that are highly colored. A modification is described, which extends the usefulness of the method to highly colored samples, such as sewage and industrial effluents. A pH meter was substituted for indicators and the use of standardized concentrations and amounts of reagents was incorporated into the method. The procedural steps were studied in order to optimize the sensitivity while minimizing interfering side reactions. The modified method was applied to a mixed domestic-industrial effluent spiked with bromide and iodide. The experimental details and statistical parameters for samples spiked at different levels are presented. (Witt-IPC)

**APPARATUS FOR CONCENTRATION OF VOLATILE ORGANIC POLLUTANTS IN WATER,**
Tekmar Co., Cincinnati, Ohio.
J. O. Grote.
American Laboratory, Vol 7, No 7, p 47-48, 50, July, 1975. 7 fig, 3 ref.

Descriptors: *Organic compounds, *Water analysis, *Pollutant identification, *Instrumentation, Analytical techniques, Water pollution sources, Trace elements, Sampling, Water chemistry, Water properties, Waste water(Pollution), Potable water, Pollutants.

In the liquid sample concentrator described, produced by Tekmar Company, an inert gas is bubbled through a water sample containing organic compounds. The volatile organics exhibiting low solubility in water are quantitatively partitioned into the gas phase, and the gas is passed through a trap that retains the organics but allows the water vapor and the purge gas to pass through. The concentrated sample is passed to a measuring instrument. By varying the type of adsorbent in the trap, the specificity of the technique can be changed to accommodate various classes of organic compounds. Data are presented illustrating the recovery of organic compounds such as acetone, methylene chloride, chloroform, carbon tetrachloride, and benzene from spiked water and drinking water. The apparatus is a useful tool for the analysis of volatile organic pollutants in water at the parts-per-billion level. Its compatibility with existing gas chromatographs and detector systems makes it adaptable to a variety of gas chromatographs and measurement devices. (Witt-IPC)
W75-11342

**INTERFERENCE OF SULFATE ION ON SPADNS (SODIUM 2-(SULFOPHENYLAZO)-1,8-DIHYDROXYNAPHTHALENE-3,6-DISULFONATE) COLORIMETRIC DETERMINATION OF FLUORINE IN WASTE WATERS,**
Calgon Corp., Pittsburgh, Pa. Calgon Labs.
R. F. Devine, and G. L. Partington.
Environmental Science and Technology, Vol 9, No 7, p 678-679, July, 1975. 4 ref.

Descriptors: *Waste water(Pollution), *Water analysis, *Colorimetry, *Sulfates, *Fluorides, Analytical techniques, Chemical analysis, Electrodes, Ions, Water pollution sources, Trace elements, Water chemistry, Water properties, Water pollution, *Pollutant identification.
Identifiers: Sodium 2-(sulfophenylazo)-1,8-dihydroxynaphthalene-3,6-disulfonate.

The approved method for the determination of fluoride ion is the SPADNS colorimetric procedure preceded by distillation from a sulfuric acid solution. This procedure is based upon the measurement of the loss of color of a zirconium-dye lake owing to the reaction of fluoride ion with zirconium to form a colorless complex ion. The dye used is sodium 2-(p-sulfophenylazo)-1,8-dihydroxynaphthalene-3,6-disulfonate (SPADNS). Serious errors in this method are caused by sulfate ion carry-over from the initial distillation step. The use of a fluoride ion electrode is suggested as a better method. (Witt-IPC)

**CHROMATOGRAPHIC DETERMINATION OF PHENOLS IN WATER,**
Ames Lab., Iowa.
C. D. Chriswell, R. C. Chang, and J. S. Fritz.
Analytical Chemistry, Vol 47, No 8, p 1325-1329, July, 1975. 2 fig, 3 tab, 13 ref.

Descriptors: *Water analysis, *Phenols, *Anion exchange, *Gas chromatography, Separation techniques, Analytical techniques, Chemical analysis, Natural streams, Potable water, Water chemistry, Water properties, Water quality, Water pollution sources, Pollutants, *Pollutant identification, Organic compounds, Resins, Ion exchange, Chromatography, Oxidation, Chlorination.
Identifiers: A-26 resin, Chlorinated phenols.

Phenols in natural waters and treated drinking water are determined by sorption on macroporous anion-exchange resin (A-26 resin from Rohm and Haas Chemical Company), elution with acetone, and measurement by gas chromatography. Techniques are given for preventing phenol losses caused by chlorination, oxidation, and other reactions during their determination. Common inorganic ions and many organic substances cause no interference; neutral organics that are retained by the resin can be removed by a methanol wash. The method gives accurate results for phenol, alkyl-, and chloro-substituted phenols in the parts/billion to parts/million concentration range. (Witt-IPC)

Descriptors: *Powerplants, *Design criteria, Optimum development plans, *Cooling water, Hydraulic models, Channels, *Discharge(Water), Thermal pollution.
Identifiers: *Portugal(Rio Sado), Once-through cooling system, Cooling water systems.

The Setubal power Plant is a fossil fueled generating station located on the Rio Sado in Portugal. It employs a once-through cooling system. The objective was to arrive at an optimal design for the cooling water system with respect to two criteria: (1) minimization of heat recirculation at the cool water intake and (2) small surface velocities in the vicinity of the discharge zone to avoid any hazard to navigation. Two designs for the condenser discharge were considered: discharge by means of a surface channel and discharge by means of a submerged multiport diffuser. The intake design is a skimmer wall that selectively withdraws cooling water from the ambient stratified water. Existing theoretical models were used to obtain preliminary estimates of design parameters. A hydraulic scale model for the discharge-intake zone was constructed. Tests were carried out to investigate the variability of the criteria of concern to the design parameters under the full range of ambient conditions. Based on the results of the experiments, a surface discharge channel is recommended as the optimal design for the cooling water system. Experimental data for both the surface discharge and the submerged diffuser were compared with existing mathematical models.

,
Lake Washington(Wash), Antimony,
er.

igh arsenic concentrations (greater
dry weight) in the surface sediments
ington are attributed to atmospheric input of partially soluble arsenic-rich dust from a copper smelter 35 km upwind and removal of dissolved As from the lake water by bacteria on an inorganic reaction. The suspended matter in the deeper lake water contains 9% iron, 8% manganese, and 350 ppm arsenic. Cores dated by Pb210 indicate that As levels began to increase in the sediments when the smelter began operation in 1890. An arsenic budget for the lake shows equal supplies from the atmosphere and from rivers, and removal by outflowing water (45%) and by accumulation in the sediments (55%). A similar cycle was observed for antimony which is released by the smelter in much smaller amounts than arsenic. About two-thirds of the As in rain and lake water was in the form of arsenate; however, in the interstitial water 55% of the dissolved As was present as arsenite and a few percent as dimethylarsinic acid. **SURFACE TENSION REDUCTIONS AND URBAN WASTES IN THE NEW YORK BIGHT,**
State Univ. of New York Stony Brook. Marine Sciences Research Center.
C. D. Hardy, and E. R. Baylor.
Journal of Geophysical Research, Vol 80, No 18, p 2696-2699, June 20, 1975. 1 fig, 21 ref.

Descriptors: *Path of pollutants, *Surface tension, *Surfactants, Water properties, *Monomolecular films, New York Properties, Tension, Surfaces, Wettability, Detergents, Water pollution sources, Sewage sludge, Water quality, Sea water, Sludge disposal, Films, Waste disposal, Sewage effluents, Pollutants, Metals, Aerosols.
Identifiers: *Urban wastes, *New York Bight, *New York Harbor, Oil drop method, Lipophilic pollutants, Metallic pollutants.

The distribution of surface tension in the New York Bight was calculated from oil drop spreading measurements at sea. Reductions in surface tensions of greater than 30% (less than 50.9 dyn/cm) of that calculated for clean seawater were associated with sewage sludge dumping and urban waste discharges. The potential role of surface films as an agent in the transport of metallic and lipophilic pollutants was briefly discussed. (Henley-ISWS)

**QUALITY OF WATER IN AQUIFERS OF THE AMARGOSA DESERT AND VICINITY, NEVADA,**
Geological Survey, Denver, Colo.
B. P. Robinson, and W. A. Beetem.
Available from National Technical Information Service, Springfield, Va 22161 as USGS-474-215 (NTS-123), $5.45 in paper copy, $2.25 in microfiche. Report USGS-474-215 (NTS-123), 1975. 64 p, 1 fig, 1 tab.

Descriptors: *Water pollution sources, *Groundwater, *Nuclear explosions, *Nevada, Water quality, Water wells, Pumping, Aquifers, Chemical analysis, Data collections, Sampling.
Identifiers: *Nevada Atomic Test Site.

The U.S. Geological Survey has interpreted the rate and direction of groundwater movement away from the Nevada Atomic Test Site by using hydrologic data including results of hydraulic tests and geophysical surveys in deep wells. Samples of water were collected from 25 sources including supply wells, irrigation wells, and springs in the Pahrump, Amargosa, and Indian Spring Valleys and at the Nevada Test Site during a single sampling sweep. Analyses in the field indicated that the composition of the pumped or discharging water approximated the composition of the aquifer water. The composition of the water did not change with extended pumping time. On-site examination of the samples of water included measurement of specific conductance, temperature, pH, dissolved oxygen, dissolved carbon dioxide, alkalinity, and ferrous-ferric iron ratios. Laboratory examination of the samples included chemical, radiochemical, and spectrochemical analyses. (Woodard-USGS)
W75-10932

**HEAVY METALS AND OTHER TRACE ELEMENTS,**
Geological Survey, Menlo Park, Calif.
H. V. Leland, E. D. Copenhaver, and D. J. Wilkes.
Journal Water Pollution Control Federation, Vol 47, No 6, p 1635-1656, June 1975. 1 tab, 201 ref.

Descriptors: *Water pollution sources, *Heavy metals, *Trace elements, *United States, *Reviews, Surface waters, Sediments, Rivers, Estuaries, Natural streams, Ecosystems, Biological communities, Marine biology.

This literature review describes the effects of heavy metals and trace elements in surface waters of the United States under the following headings: (1) Trace Elements in Natural Waters; (2) Trace Elements in Sediments; (3) Physical-Chemical Forms of Trace Elements; (4) Trace Element Partitioning in Aquatic Ecosystems; and (5) Bioaccumulation and Toxicity of Trace Elements. Scattered and intensive chemical surveys of natural waters in the U.S. continue to show that many trace elements, including As, Cd, Pb, Hg, and Zn, are widely distributed but at low concentrations relative to the limits established for drinking waters. The geographic distributions of Cd, Pb, and Zn have distinct regional patterns. Pollution sources and rainfall are apparently the major contributors of Cd and Pb in river water. (Woodard-USGS)

Identifiers: *Deep sedimentary basins.

The conference on Hydrology of Deep Sedimentary Basins sponsored by the American Association of Petroleum Geologists (AAPG) was held at Shangri-la resort, Afton, Oklahoma, October 7-11, 1974. Participants numbered 60, and included representatives from oil company laboratories, government bureaus, and universities. The conference produced an interesting difference of opinion on the movement of deep subsurface waters. Most of the hydrologists present, and some of the petroleum geologists, believe that deep subsurface pore waters are moving both parallel with and perpendicular to bedding planes. The movement is caused by the compaction of sediments, phase changes in the minerals, and head differences caused by topography. These people believe that the salt in subsurface brines was concentrated by reverse osmosis, that hydrodynamically tilted water-oil contacts are common, and that updip or downdip flows of water in sandstones can enhance or destroy petroleum traps. Others believe that shales commonly lose all their permeability to water, at least in a direction perpendicular to the bedding. (Woodard-USGS)

**USE OF PRODUCTIVITY OF PERIPHYTON TO ESTIMATE WATER QUALITY,**
Geological Survey, Menlo Park, Calif.
L. J. Tilley, and W. L. Haushild.

Journal Water Pollution Control Federation, Vol 47, No 8, p 2157-2171, August 1975. 8 fig, 4 tab, 29 ref.

Descriptors: *Water quality control, *Path of pollutants, *Waste water disposal, *Washington, Streams, Estuaries, Methodology, *Periphyton, Growth rates, Chlorophyll, Nutrients, Phosphates, Ammonia, Nitrates, Water quality, Streamflow, Flow rates, *Bioindicators, Pollutant identification.
Identifiers: *Duwamish-Green River(Wash).

In a comprehensive study of the effects of changes in wastewater disposal practices on the Duwamish River (Wash.) estuary, the amount and rate of change of chlorophyll a was used to determine the net primary productivity of the periphyton growing upstream from the estuary in the Duwamish-Green River. The net primary productivity varied among three stream environments sampled in the study during the summer and fall of 1969. Net primary productivity averaged 3.6 mg/wk/sq m in a mountainous reach, increased to 6.2 in a lowland reach, and was as much as 17.5 in an estuarine reach. The productivity of periphyton was related to concentration of selected nutrients (nitrate, nitrite, ammonia, and phosphate) in the stream. The small temperature changes along the stream probably had a minor influence on the differences in periphyton growth rates. (Woodard-USGS)

**ILLINOIS LANDFILL LAW MAY EFFECT NEARBY STATES.**
Solid Wastes Management, Vol 17, No 8, p 36, 46, 58, 72, 78-79, August, 1974.

Descriptors: *Landfills, *Solid wastes, *Waste disposal, *Legislation, *Illinois, Regulation, permits, Environmental sanitation, Water pollution sources, Water pollution control.

The Pollution Control Board of Illinois was developed a broad-based policy on the control of landfill operations. The key provision states that no person in any state may allow a sanitary site to be maintained so as to threaten or permit the discharge or emission of pollutants into the environment so that they may in any way contaminate the air and/or water within the state of Illinois. This means that any individual or organization that is in violation of the law is liable for his act even though the initial polluting may have occurred outside of the state of Illinois. An outline of the legislation is presented. Subjects covered include permits, methods of operation, type of wastes that may be deposited, features that must be included in a landfill site, and items that must be contained in an application for a landfill permit. Development permits are required for the development of any new solid wastes management site or for the modification of an existing site. Operating permits are required to operate a site. Experimental permits will be issued for methods that do not satisfy the current standards if the applicant can show proof that the method has a reasonable chance for success and that there are minimal environmental hazards. (Orr-FIRL)

**PREVENTING BACKFLOW IN PIPING CROSS CONNECTIONS,**
Watts Regulator Co., Lawrence, Mass.
J. F. Keegan.
Plant Engineering, Vol 29, No 8, p 229-231, April 17, 1975. 6 fig, 2 tab.

Descriptors: *Water pollution sources, *Potable water, Pipes, Water supply.
Identifiers: Cross connections, Piping, Backflow.

Inadvertent contamination of potable water supplies may be avoided by preventing backflow in piping cross connections. Two types of uncontrolled cross connections which permit unwanted reverse flow are back siphonage and backpressure. Siphonage occurs when a water supply system is subjected to an unexpected pressure drop. Backflow from backpressure results when a system component such as a pump or a boiler under pressure produces a pressure exceeding that of the water supply main. In some cases, a combination of back siphonage and backpressure cause backflow. To overcome the possibility of contamination by backflow, in-plant cross connection control programs should be implemented. Backflow prevention devices are described. These cross connections are either the inlet type or the pressure type. In the inlet type, the connection is used for filling a receptacle open to the atmosphere while in the pressure type, water supply is connected to another line or to a pressurized vessel. In the latter, connections are often fitted with shutoff or check valves to isolate nonpotable systems from the potable supply. Selection of the proper prevention device depends upon the type of cross connection to be connected and the degree of hazard existing. (Prqgue-FIRL)
W75-11018

**STABILITY OF NITROSAMINES IN SAMPLES OF LAKE WATER, SOIL, AND SEWAGE,**
Cornell Univ., Ithaca, N.Y. Lab. of Soil Microbiology.
R. L. Tate, III, and M. Alexander.
Journal of the National Cancer Institute, Vol 54, No 2, p 327-330, February, 1975. 5 fig, 17 ref.

Descriptors: *Nitrogen compounds, *Soil environment, *Sewage, *Lakes, Water pollution sources, Microbial degradation, Persistance, Pollutant identification, Laboratory tests, Testing, Public health, *Path of pollutants.
Identifiers: *Nitrosamines, *Carcinogens.

Interest in nitrosames is prompted because of their possible carcinogenic, teratogenic, and mutagenic properties. Their possible synthesis in fresh waters, polluted waters, and soil is of some concern because the precursors are widespread. The significance of the formation of N-nitroso compounds depends upon the stability of these carcinogens in natural systems and their possible entry into public water supplies, fish, and edible plants. This study assessed the stability of simple nitrosamines (N-nitrosodimethylamine, N-nitrosodiethylamine, and N-nitrosadi-n-propylamine) in lake water, soil, and sewage. No degradation of these nitrosamines was observed in lake water during a 3.5 month period. A slow disappearance was noted in soil after a lag of several weeks. The loss was more rapid in sewage, but even after two weeks more than half of the nitrosamine remained. The results of the experiments of sewage and soil suggest a microbial involvement in the slow decomposition of the nitrosamines. (Orr-FIRL)

**SOME OBSERVATIONS ON BEHAVIOR OF THE TREATED SEWAGE DISPOSED IN THE SEA,**
Nihon Univ., Tokyo (Japan). Dept. of Fisheries.
D. Inaba, S. Arazaki, H. Murooka, Y. Deguchi, and S. Kadota.
Bulletin of the College of Agriculture and Veterinary Medicine, Nihon University, No 31, p 54-78, 1974. 15 fig, 8 tab, 4 ref.

Descriptors: *Sludge disposal, *Oceans, *Environmental effects, Marine animals, Analytical techniques, Sewage treatment, Monitoring, Pollutant identification, Water quality control, Ultimate disposal, *Path of pollutants, Dispersion, Mixing.
Identifiers: Pollutant dispersal, *Japan.

A survey of marine disposal of sludge from sewage treatment was conducted in Japan, in order to obtain information on dispersal characteristics in the ocean and to detect effects of this disposal method on water quality and marine life. Color differentiation between sludge water surface and clean water areas was observed just after introduction of the sludge. Vertical sedimentation rate was measured by optical monitoring through marine television, echo sounder devices and an underwater illuminometer. Particles precipitated into the water at different rates of descent due to specific gravity and differences in particle shape. Water quality analysis was done in relation to ammonia density, BOD, and pH parameters, indicating that these factors did not cause any significant qualitative changes to the environment. Strong winds and high waves provided a rapid dispersal and mixing of the sludge in the aquatic environment. These rapid mixing and dispersal factors are also illustrated by an unexpectedly low general and coliform bacteria count. (Prague-FIRL)

Identifiers: 90Sr, 137Cs, 144Ce, Marine pollutio

The behavior of artificial radionuclides in s water has been shown to differ from the behav of natural isotopes, at least within a duration time after the artificial substances have been troduced into the sea. The physico-chemical sta of artificial radionuclides 90Sr, 137Cs, and 144 in seawater were studied by radio-chemical ana sis of filtered and unfiltered seawater, in orde understand and predict the radioactive contami tion of the marine environment. These fal radionuclides were analyzed, and the differenc radionuclide concentrations between unfilte and filtered seawater was defined as the part late form radioisotope. A considerable amoun 144Ce was found to be particulate. Almost no greater than 0.22 microns in size was observe either coastal or open seawaters, but much 13 seemed to be insoluble in coastal waters. For Kashima-nada area, the possible occurence of ticulate radionuclides greater than 0.22 micro size was estimated, and was found to one per or less for 90Sr and 6 percent for 137Cs. In co water, 80 percent of 144Ce were in partic form, but very little particulate 144Ce was f in the open seawater. The influence of suspe matter to 137Cs and 144Ce concentration leve seawater is as yet undetermined. (Prague-FIR W75-11022

Descriptors: *Dispersion, *Dissolved oxygen, Mathematical models, Mixing, *Reaeration, Turbulence, *Self-purification, Recreation, Planning, Management, Streams, *Utah, Model studies, Tracers, Dye dispersion, *Path of pollutants.
Identifiers: Summit Creek(Utah), Mountain creeks.

Reaeration process studies were conducted on a mountain creek and a large laboratory flume. The method of evaluating the dispersion coefficient, mean velocity, and reaeration coefficient for both creek and flume consisted of finding these values for a deoxygenated portion of the flow containing a conservative tracer (dye). The deoxygenated slug is measured as it moves downstream and the three values are best fit in the analytical solution of the longitudinal dispersion equation which dynamically describes the flow of the dispersing slug in the stream. The best fit was accomplished by using the method of least squares in which the sum of squares of the differences between the dissolved oxygen and dye concentrations calculated from the dispersion equation and those obtained from the actual measurements is minimized. A reaeration coefficient prediction model of general form was developed. The model is composed of two dimensionless parameters which were identified from the normalized dissolved-oxygen balance equation. A simplified model which has two model parameters was also developed. Both model parameters were evaluated specifically for the mountain creek and laboratory flume. A comparison of this simplified model with existing models revealed that most existing models are incomplete in form. Inclusion of the dispersion coefficient in the reaeration coefficient model improved the prediction accuracy. The information obtained from this study would aid in the determining of oxygen balance of mountain creeks which is essential to the resource management of mountain watersheds.

Identifiers: *Pacific oyster, *Crassostrea gigas, *Bioaccumulation, *Tissue analysis, Tamar River(Tasmania).

Pacific oysters (Crassostrea gigas) and mud samples from the Tamar River were analyzed for copper, cadmium, zinc, lead and chromium. Concentrations of cadmium, zinc and copper found in oysters were 10-40 times the concentrations in inhabited muds. Copper and chromium appeared to be absorbed up to a weight limited by oyster size and was independent of metal concentration in the mud. Lead was not absorbed through any physiological demand, but was randomly incorporated at sites containing high concentrations in the mud. Zinc and cadmium were accumulated dependent on their concentrations in the mud. The concentrations of zinc and cadmium in muds may be used to indicate whether a site is grossly unsuited for the culture of oysters. (Katz)

**THE WATER QUALITY AND BOTTOM SEDIMENT CHARACTERISTICS OF NEW JERSEY LAGOON DEVELOPMENTS,**
Rutgers - the State Univ., New Brunswick, N.J.
E. H. Thurlow.
Available from University Microfilms, Inc., Ann Arbor, Mich, 48106. Order No 75-8450. PhD Thesis, 1974, 360 p.

Descriptors: *Waste disposal, *Lagoons, *Sewage, *Water quality control, *New Jersey, Heavy metals, Sedimentation, Pollutant identification, Water pollution sources.
Identifiers: Bottom sediments.

A three year study of four lagoon developments near Ocean County, New Jersey, was conducted to determine the nature of the water and bottom sediments, and the effects of types of waste disposal systems. It was found that each lagoon development had its own characteristic channel arrangement, amount and type of fresh water input, and inland penetration. Depth was a major factor influencing water quality; depths within and between lagoon systems were variable. Because lagoon areas are usually deeper than the adjacent bay, there was a hindering of water exchange and stagnant conditions are created in the bottom waters. As the shallowest area of the lagoon is usually at the mouth, the deeper remote points tended to be slightly more polluted due to depth, fresh water input, or poor water circulation. NH4(N), NO3(N), NO2(N), PO4, Cl, SO4, and some heavy metals, as well as anaerobic conditions were found accumulated in very deep lagoon areas. Lagoon sediments tended to be high in organic matter, total nitrogen content, CEC, and exchangeable cations, and to be black musks with H2S odors. An increase in population had an adverse effect on both the water quality and bottom sediments through increased addition of pollutants and organic materials from sewage, homes, and boats. Water quality in unsewered lagoons was better than quality of water in sewered lagoons, but bottom sediments of each were similar. (Prague-FIRL)

Descriptors: *Public health, *Water supply, *Phenols, *Potable water, Wells, Human pathology, Mortality, Water pollution sources, Water pollution effects, Water wells.
Identifiers: *Endemic nephropathy, *Romania(Barsa-Arad).

Phenolic compounds were found in the water of wells in the commune of Barsa-Arad. Eleven persons died after drinking this water and 9 other persons were ill with endemic nephropathy. The concentrations of phenolics varied between 28 and 203 gamma/liter. The concentration levels were found to be distributed in three rows at the base of the ground level elevation existing in this locality of the bank of the Morilor channel. A similarity was determined to exist between the peculiarities of contamination with phenolic compounds in the Barsa-Arad region and of other zones of endemic nephropathy in the Secaseni (Caras-Severin District) and Strehaia (Mehedinti District) of Romania. **DRUG RESISTANT COLIFORMS CALL RE-EVALUATION OF WATER QUAL STANDARDS,**
National Inst. for Water Research, Pretoria (S Africa).
W. O. K. Grabow, O. W. Prozesky, and L. S. Smith.
Water Pollution Control, Vol 74, No 2, p 217 1975. 1 tab, 120 ref.

Descriptors: *Coliforms, *Sewage bac Pathogenic bacteria, *Water quality stand Sewage treatment, Enteric bacteria, Public h E. coli, Water pollution sources.
Identifiers: *Drug resistant bacteria, *R facto

Evidence is presented to support the idea water polluted with coliform and other ba generally considered as non-pathogenic tributes to the incidence of drug resistance a bacteria involved in disease. Resistance to dr imparted by chromosomal resistance and sistance (R) factors. R factors are trachromosomal nucleic acid elements (pla which replicate autonomously. R factors are missible among Gram negative bacteria such terobacteria including E. coli, Salmonella and Shigella dysenteriae. Ingestion of bacter rying R factors (R+ bacteria) can result transfer of these factors to the normal int flora. These organisms then act as a reser resistance which they may transfer to se bacteria involved in disease. The two which are involved in the spread of R+ b are drug resistance which selects for res plasmids and the transmission of these org from excretors to the rest of the pop through sewage. Two percent of the colif sewage and in sewage polluted water can pected to carry R factors (maximum 26 hospital effluent). Current water quality st regard coliforms as purely indicators of fe lution. However, since plasmid infected co have been shown to be joined with bact creasingly involved in disease, they can n be regarded as harmless. This necessitat evaluation of quantitative and qualitativ criteria as well as increasing the list of rea more advanced sewage treatment. (Orr-FI W75-11130

**DISSOLVED GAS SUPERSATURATION AND DILUTION IN THERMAL PLUMES FROM STEAM ELECTRIC GENERATING STATIONS,**
Texas Univ. at Dallas, Richardson. Inst. for Environmental Sciences.
G. F. Lee, and P. H. Martin.
Water Research, Vol 9, No 7, p 643-648, July 1975. 2 tab, 9 ref.

Descriptors: *Supersaturation, *Gases, *Cooling water, *Powerplants, Nitrogen, Oxygen, Waste dilution, Discharge(Water), Thermal powerplants, Nuclear powerplants, Electric powerplants, Fish, On-site investigations, Water pollution, Velocity, Heated water, *Thermal pollution.

The use of natural waters for waste heat dissipation for steam electric generating stations using once-through cooling creates potential problems of dissolved gas supersaturation in the thermal discharge plume for fish that can reside in the plume. Computations were presented which show the amount of dissolved gas supersaturation that would be expected in thermal discharge plumes employing offshore high velocity discharge and onshore low velocity discharge. It was predicted that dissolved gas supersaturation problems would be rare for steam electric generating stations utilizing high velocity offshore discharge for cooling water/heat dissipation because of the rapid dilution that occurs in the discharge plume. However, problems of this type would be expected for low velocity discharges. It was also shown that the rate of dilution from high velocity discharges would tend to minimize the environmental impact of chemicals (such as chlorine) used for condenser fouling control. (Sims-ISWS)

**BEHAVIOR OF MN, FE, CU, ZN, CD AND PB DISCHARGED FROM A WASTEWATER TREATMENT PLANT INTO AN ESTUARINE ENVIRONMENT,**
Maryland Univ., College Park. Dept. of Chemistry.
G. R. Helz, R. J. Huggett, and J. M. Hill.
Water Research, Vol 9, No 7, p 631-636, July 1975. 6 fig, 1 tab, 23 ref. NSF Grant GI-38973.

Descriptors: *Trace elements, *Metals, *Water pollution, *Estuaries, *Maryland, Manganese, Iron, Copper, Zinc, Cadmium, Lead, Heavy metals, Pollutants, Sampling, Chemical analysis, Water pollution sources, Wastes, Sewage effluents, Sediments, Path of pollutants.
Identifiers: *Back River(Md).

To obtain information on the fate of trace metals discharged to an estuarine environment, analyses were made on water and sediment samples from Back River, Maryland, and on effluent from the large wastewater treatment plant that discharges there. Within 2-3 km of the outfall, the concentration (in micrograms/liter) of all metals decreases as follows: Mn, greater than 120-90. Fe, greater than 570-300; Cu, 53-7; Zn, 280-9; Cd, 3.5-0.5 and Pb, 31- less than 4. Except possibly for Mn and Fe, these decreases are much greater than can be ascribed to simple dilution, so physical, chemical or biological processes must be removing metals to the sediments. Correspondingly, sediment concentrations of Cu, Zn, Cd, and Pb are approximately one order of magnitude higher than normally found in uncontaminated areas. After the initial decrease, concentrations of Mn and Cd in the water begin to rise again, suggesting remobilization from the sediments. Comparison of the estimated annual discharge of 8 trace metals to the Chesapeake Bay from wastewater treatment plants and from rivers suggests that the wastewater input may be within one order of magnitude of the fluvial input for Cr, Cu, Zn, Cd, and Pb. Of the metals studied, Cd presents the greatest potential for serious pollution because its input from wastewater probably exceeds fluvial input, it appears to be readily remobilized from sediments, and it is known to be toxic to many organisms. **MUTAGENS AND POTENTIAL MUTAGENS IN THE BIOSPHERE: I. DDT AND ITS METABOLITES, POLYCHLORINATED BIPHENYLS, CHLORODIOXINS, POLYCYCLIC AROMATIC HYDROCARBONS, HALOETHERS,**
National Center for Toxicological Research, Jefferson, Ark.
L. Fishbein.
Sci Total Environ, Vol 2, No 4, p 305-340, 1974. Illus.

Descriptors: *DDT, *Polychlorinated biphenyls, *Chlorinated hydrocarbon pesticides, Distribution, Path of pollutants, Reviews, Toxicity.
Identifiers: Aromatic hydrocarbons, Biosphere, Chlorodioxins, Ethers, Metabolites, *Mutagens, Toxicology

For proper assessment of actual risks, the interactions between different modes of administration of a toxicant must be understood and the probable impingement of the environmental substances upon the various portals of entry must be known. To best understand this last requirement we must know how the toxicants in question are distributed in and are transported through the environment to finally impact on man. In this review, a small number of mutagens and potential mutagens (e.g., DDT and its metabolites, polychlorinated biphenyls, chlorinated dioxins, polycyclic aromatic hydrocarbons and haloethers) are evaluated in terms of their occurrence, use patterns, distributions and impact in the environment. In many cases the information is fragmentary; e.g., patterns of region and local variation of the toxicants have been only superficially investigated and the detailed pathways of residues within the trophic networks are poorly understood. The physiological and ecological effects of the toxicants at sublethal levels are also to a large extent unknown. More information is needed as to the production (nature of reactants, amounts, reactivity, disposal, etc.), import and export data for specific potential environmental toxicants, the nature and routes of their global transport, and the concentration, longevity, biochemical and toxicological activity of their residues (including specific chemical nature) that occur in their various biosphere compartments including air, water, soil, and biota. Descriptors: *Monitoring, *Aquatic weed control, *2-4-D, *Bioassay, *Pesticide residues, *Tennessee Valley Authority, Tennessee River, Benthos, Clams, Mussels, Insects, Rates of application, Bottom sediments, Fish, Potable water, Tennessee, Alabama, Reservoirs.
Identifiers: Water milfoil.

Eurasian water milfoil in seven TVA reservoirs from Melton Hill in east Tennessee to Wilson Dam north Alabama was treated with 2,4-D butoxyethanol ester. 2,4-D did not depress benthic insects (especially Hexagenia nymphs), clams, and mussels, but milfoil eradication eliminated substrates for epiphytic insects (immature midges, mayflies, and dragonflies). Forty percent of samples of mud, fish, milfoil, mussels, and Asiatic clams contained less than 0.10 ppm of 2,4-D residues; fish showed little uptake, mussels some, and some mud samples contained significant concentrations for 10 months. Net tests showed that 40-100 pounds 2,4-D per acre caused some movement of fish from treated areas, but there were no distressed or dead native fish. Laboratory tests indicated that complete control of milfoil can be obtained with exposures of 3 ppm 2,4-D for 5 hours, 1 ppm for 48 hours, or 0.1 ppm for about 30 days. A sensitive bioassay technique for measuring 2,4-D residues in reservoirs was developed. Following treatment with granular 2,4-D, 2,4-D residues were initially high at the water surface, then decreased. The rate of decrease depended on the degree of dilution by water movement. Water treatment plants along the Tennessee River system were monitored for 2,4-D residues using carbon filters. (See also W75-08289) (Buchanan-Davidson--Wisconsin)

**DISSIPATION OF RESIDUES OF PHENOXY HERBICIDES APPLIED TO THE WATERSHED,**
Oregon State Univ., Corvallis. School of Forestry.
L. E. Norris.
In: Proceedings, Research Planning Conference on Integrated Systems of Aquatic Plant Control, October 29-30, 1973, Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, p E5-E12, August 1974. 5 tab, 6 ref.

Descriptors: *Pesticide residues, *Weed control, *Watersheds(Basins), *Vegetation, *Oregon, Herbicides, 2-4-D, 2-4-5-T, Path of pollutants, Leaching, Persistence, Surface runoff, Streams, Forests.
Identifiers: Cascade Creek Watershed(Ore), Eddyville Watershed(Ore), Malheur National Forest(Ore), Terrestrial vegetation.

Spray projects in Oregon illustrate application methods to minimize residues of phenoxy herbicides in streams and runoff. When the Cascade Creek Watershed was sprayed with 2,4,5-T and the Eddyville Watershed and Malheur National Forest were treated with 2,4-D, there was usually a short period of contamination. The magnitude of contamination was not a function of the herbicide or geographical location, but was closely related to the manner in which the treatment area was laid out with respect to live streams. When spray boundaries were close to, but did not include, live streams, downstream herbicide concentrations were low and persisted for only a short time. When there was standing water and a high water table, high concentrations of herbicides were found shortly after application and persisted for long periods of time. Leaching and surface runoff can move chemicals from deposit areas to streams. Surface flow can carry large amounts of chemicals long distances in a short time. This rarely occurs in western forests since the infiltration capacity of the forest floor and soil is much larger than the precipitation. Most pesticide residues enter the soil where absorption prevents their movement. Leaching is slow and moves only small amounts of herbicide short distances. (See also W75-08289) (Buchanan-Davidson--Wisconsin)

**DISSIPATION OF PHENOXY HERBICIDES APPLIED TO RIPARIAN VEGETATION,**
Pennsylvania State Univ., University Park. School of Forestry.
W. E. Sopper.
In: Proceedings, Research Planning Conference on Integrated Systems of Aquatic Plant Control, October 29-30, 1973, Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, p E13-E16, August 1974.

Descriptors: *Herbicides, *Pesticide residues, *Riparian plants, Banks, Brush control, Spraying, Streams, Watershed management, Watersheds(Basins), *New Jersey, *Pennsylvania, 2-4-D, 2-4-5-T, Vegetation, Potable water, Rates of application.

To determine the extent of streamflow contamination following the spraying of riparian vegetation with phenoxy herbicides, the banks of small headwater streams of the Newark, New Jersey watershed and Stone Valley Experimental Forest in Pennsylvania were sprayed with a 2,4,5-T ester or emulsifiable acid during a low streamflow period (flow less than 0.1 cfs (45 gpm)). During the three weeks after treatment, odor contamination was only observed in the treated reach of the stream immediately after spraying and after the first large storm. No contamination was found downstream. The ester formulation had completely killed 70-81% of the brush stems, and the emulsifiable acid had killed 58-78%. From 17-32% of the remaining stems were partially killed. A subsequent treatment in 3-5 years should eliminate the remaining stems. New streambank vegetation was primarily grasses and herbaceous species which should eventually predominate. Phenoxy herbicides can therefore be used to control riparian vegetation on municipal watersheds if properly applied with normal precautions. (See also W75-08289) (Buchanan-Davidson--Wisconsin)

**CHELATION STUDY OF COPPER (II): FULVIC ACID SYSTEM,**
Canada Centre for Inland Waters, Burlington (Ontario).
V. Cheam.
Canadian Journal of Soil Science, Vol 53, No 4, p 377-382, 1973. 2 fig, 1 tab, 29 ref.

Descriptors: Analytical techniques, *Humic acids, *Chelation, *Fulvic acids, *Copper, *Volumetric analysis, Electrodes, Chemical reactions, Organic acids, Ions, Chemical analysis, *Pollutant identification, *Water pollution.

Complexing of humic compounds was studied using an ion-selective electrode. Chelation between copper ion and fulvic acid using a solid state electrode reversible to this ion occurred at the salicyclic acid-like bidentate sites of fulvic acid, which consists of phenolic hydroxyl groups ortho to ionized carboxyl groups. The mass action quotient (equilibrium quotient) varied with pH and mole fractions less than 0.3. The pH 3 curve of copper-fulvic acid chelation leveled off at mole fractions of 0.3-0.7, indicating that the equilibrium constant does not depend on reactant concentrations; this is consistent with the assumption that the chelate is a 1:1 type complex. In this composition range the best mass action quotient value is 2.2. Assuming that the pH 4 and 5 curves behaved similarly in this mole fraction range, the mass action quotients would be about 0.6 and 0.25, respectively. Under these conditions fulvic acid appeared to be a stronger chelating agent than salicyclic acid. Higher complexes may exist when the mole fraction is smaller than 0.3. Under conditions found in natural lake waters, copper is probably strongly bonded to fulvic acid. Other trace elements may act in a similar way toward fulvic acid and humic substances. Descriptors: *Water reuse, *Waste water t ment, Soil properties, Irrigation, Munic wastes, Sewage effluents, Soil surfaces, chemistry, *Biodegradation, Nutrients, W quality, *Humus, *Decomposing organic ma *Michigan, Forests, Vegetation, Water poll sources.
Identifiers: Soil water quality, Humus decom tion, Vegetation growth, Red pine forest, M beech hardwood forest.

The impact of municipal wastewater irrigatio soil water quality, Vegetation growth and nu status, soil chemistry, and humus decompo in a 20-year old red pine plantation and m beech hardwood forest in southern Michiga studied. The pine plantation was spray irri

ewage stabilization pond effluent during the
er and early fall of 1972-4. The hardwood
site received 25, 50 and 75 mm/week of
lary sewage effluent and 50 mm/week of
ater through a trickle irrigation system dur-
72-3. Observations and measurements were
on water quality; renovation of percolating
as determined by analysis of samples from
lysimeters; growth and nutrient status of
ion; changes in soil chemistry; changes in
mus and fungi. Recommendations included
ion of irrigation infiltration rates to 3
ur and weekly loadings to 50 mm. Max-
on of vegetative growth should be subor-
to maintaining the ecosystem in a viable
on. Toxicity of effluent pollutants such as
ould be a serious threat to certain types of
on and may limit the use of pine planta-
potential wastewater disposal sites.

R PHOSPHATE IN STREAMS AND

Coll. of Advanced Education

In: Fertilizers and the Environment. Proceedings of a Symposium, Wesley College, University of Sydney, May 13-15, 1974. Australian Institute of Agricultural Science (New South Wales Branch), Sydney, p 103-109, 1974. 1 tab, 26 ref.

Descriptors: *Fertilizers, *Phosphorus compounds, *Water pollution effects, *Path of pollutants, Reviews, Leaching, Phosphates, Agriculture, Water pollution sources, Eutrophication.

Studies of the amount and route of fertilizer phosphorus movement from the point of application into natural waters are reviewed. Generally such studies have shown that the leakage of phosphate from treated areas is low in proportion to the amount applied. However, what is considered low as a loss from the agricultural system may be considered substantial as an input to aquatic ecosystems. (CSIRO)

**BIODEGRADATION OF COMPONENTS OF PULP WASTE EFFLUENTS BY BACTERIA. (1). DEGRADATION OF KRAFT LIGNIN (IN JAPANESE),**
Nagoya Univ. (Japan). Faculty of Agriculture.
H. Kawakami, M. Sugiura, and T. Kanda.
Japan Tappi, Vol 29, No 6, p 309-315, June, 1975. 5 fig, 13 ref, 8 tab, English summary.

Descriptors: *Lignins, *Biodegradation, *Pulp wastes, Water pollution sources, Industrial wastes, Wastes, Pseudomonas, Aerobic bacteria, Bacteria, Microorganisms, Aquatic bacteria, Water pollution, Incubation, Decomposing organic matter, Organic compounds, Oxidation, Foreign research, Pine trees, Softwood, Hardwood, Molecular structure.
Identifiers: Beech trees(Fagus), Pseudomonas ovalis, Japan.

The degradation of pine and beech kraft lignin in natural water systems by Pseudomonas ovalis was investigated. After 60-day incubation, pine lignin was much more decomposed than beech lignin. The high-molecular-weight portion of the softwood lignin was appreciably affected and showed a marked increase in carbonyl groups, as well as an extreme decrease in vanillin-producing groups. These groups and syringyl groups decreased only slightly in the hardwood lignin while biphenyl, condensed 5-guaiacyl, and syringyl structures increased upon bacterial decay. Although MeO groups decreased with progressive biodegradation, phenolic and catecholic OH groups decreased also in the residual lignin. On permanganate oxidation, the residual lignin showed increases in p-hydroxyphenyl and 4-methoxyisophthalic acid groups. It appears that Ps. ovalis causes demethoxylation, rather than demethylation of kraft lignins. (Brown-IPC)

Available from the National Technical Information Service, Springfield, Va. 22161, as PB-244 533, $4.25 in paper copy, $2.25 in microfiche. Louisiana Water Resources Research Institute, Baton Rouge, Technical Report No 5, May 1975. 43 p, 6 fig, 34 tab, 28 ref. OWRT A-035-LA(1).

Descriptors: Physicochemical properties, Chemical analysis, Bioassay, *Bioindicators, *Invertebrates, *Pollutant identification, Water quality, Estuarine environment, Correlation analysis, Frequency analysis, *Louisiana, Nutrients, Phytoplankton, Primary productivity, Distribution, Eutrophication.
Identifiers: *Lake Pontchartrain(La), *Epifaunal invertebrates.

The distribution and relative abundance of estuarine epifaunal invertebrates can be used to detect water quality differences. Epifaunal invertebrate associations were affected by salinity and storm-water discharge. Differences among both biological and physico-chemical stations were related to discharge of more saline water by the Industrial Canal and quality differences of outfall canal discharge. In 1973 the opening of the Bonnet Carre Spillway added alkaline nutrient-rich, fresh water from the Mississippi River and affected all water quality parameters. Gradual changes occurred as the river water was flushed from the lake. Increased phytoplankton growth resulted from the addition of nutrients. Epifaunal invertebrates were not greatly affected because 26 predominantly estuarine taxa were present 6 weeks after the spillway was closed. Storm-water discharge by outfall canals adds plant nutrients, coliform bacteria and other undesirable substances to the lake. Salinity was lower, but alkalinity, pH and nutrient values were higher due to the spillway opening and heavy rainfall. There was a west-to-east gradient of changing water quality in near-shore stations. Stations near outfall canals in Jefferson Parish had higher nutrient values and lower dissolved oxygen concentration than did similar areas in Orleans Parish. Salinities were higher in Orleans Parish and highest near the Inner Harbor Navigation Canal. Near-shore areas should no be used for recreational activities such as swimming or water skiing because of high concentrations of fecal coliform bacteria.

**OIL POLLUTION AND SEABIRDS IN DENMARK 1935-1968,**
Game Biology Station, Ronde (Denmark).
A. H. Joensen.
Dan Rev Game Biol. Vol 6, No 8, p 1-24, 1972, Illus.

Descriptors: *Oil pollution, *Birds, Swans, Ducks(Wild), Gulls, Water pollution effects.

Identifiers: Alca-torda, Anas-platyrhynchos, Aythya-fuligula, Clangula-hyemalis, *Denmark, Duck, Fulicaaatra, Melanitta-fusca, Melanitta-nigra, Somateria-molissima, Uria-aalge, *Seabirds.

The number of cases of pollution involving birds increased during the period, but the increase is not so great as the increase in amount of oil transported through Danish waters. Cases of oil pollution occur throughout the year, but great numbers of birds die especially in the 2 coldest months, Jan. and Feb. Throughout the period, most Danish waters were regularly affected by cases of widespread bird mortality. Mortality due to oil mainly affected by spp., which in general are found in the sea far from shore: Somateria mollissima, Melanitta nigra, Melanitta fusca, Clangula hyemalis, Alca torda and Uria aalge. Swans were often reported oiled, but total numbers killed are comparatively small. Other species which occur in Denmark in large numbers confined mostly fresh- and brackish water and areas close to the coasts were seldom reported oiled. This is the case for Anas platyrhynchos and other dabbling ducks, Aythya fuligula, Fulica atra and gulls.--Copyright 1974, Biological Abstracts, Inc.

**CONCURRENT NITRIFICATION-DENITRIFICATION AT THE SEDIMENT-WATER INTERFACE AS A MECHANISM FOR NITROGEN LOSSES FROM LAKES,**
Wisconsin Univ., Madison. Dept. of Soil Science.
D. R. Keeney, S. Schmidt, and C. Wilkinson.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-244 503, $3.25 in paper copy, $2.25 in microfiche. Wisconsin Water Resources Center, Madison, Technical Report WIS WRC 75-07, August 1975. 21 p, 4 tab, 37 ref. OWRT A-057-WIS(1). 14-31-0001-4050.

Descriptors: *Nitrification, Ammonia, *Denitrification, Interfaces, *Lake sediments, Water quality, Nitrogen, *Sediment-water interfaces, Lakes, Nitrates, *Aeration, Oxidation-reduction potential, *Nutrient removal, Lakes.
Identifiers: Artificial aeration, *Ammonium-nitrogen.

Conditions at the sediment-water interface can, in theory, have a major impact on the nitrogen balance of the lake system. Unless the bottom waters are completely anoxic, nitrification should proceed just above the sediment. If the nitrate thus formed diffuses into the anaerobic sediment, denitrification can occur. The feasibility of nitrification-denitrification at the sediment-water interface and the effect of cyclic artificial aeration on the rate of these aerations were investigated. The approach used was to aerate a model sediment-water system, then cease aeration and allow the system to go anaerobic. This cycle was repeated several times over a 106-day period. Performance was monitored by determination of inorganic N in the water, Eh of the water, and N distribution in the sediment. Aeration of the systems consistently resulted in a decrease in ammonium-N and an increase in nitrate-N in the water and a corresponding rise in Eh to +300 to +380 mV. When the systems were not aerated, nitrate-N and Eh declined, and ammonium-N increased. The sediment remained anaerobic (-220 mV). Pore water ammonium-N and exchangeable ammonium-N in sediment cores taken after the experiment increased with sediment depth, indicating that ammonium-N was released from the sediment to the overlying water. Mass balance calculations indicated a loss of about one-third of the available N in the system. Thus, it is conceivable that nitrification-denitrification by hypolimnion aeration could remove a portion of the N loading of a lake.

Identifiers: *Chatauqua Lake(NY), *Macrophytes, Potamogeton-richardsonii, Shading, Vallisneria-americana.

Root:shoot, Leaf:shoot, and leaf surface area:weight ratios were consistent in Vallisneria americana and Potamogeton richardsonii from Chautauqua in all except the smallest individuals. Root:shoot ratio increased across the aquatic hydrosere, i.e., from submergent to floating leaf to emergent communities, but leaf area index (LAI) varied little. LAI in most undisturbed native communities ranged between 5-7 sq m/sq m but disturbed communities dominated by the alien Potamogeton crispus had LAI's of 11 sq m/sq m or more. Since these communities are very unstable and characterized by explosive growth, decreased life span, and spontaneous dieoff, and since P. crispus is an introduced species, the high LAI's may be maladjusted to local conditions. A community exhibiting high LAI's soon suffers excessive shading and spontaneous dieoffs.--Copyright 1974, Biological Abstracts, Inc.

Descriptors: *Salmonids, *Rainbow trout, *DDT, *Toxicity, *Mortality, *Fish physiology, *Fish behavior, Laboratory tests, Design, Water pollution effects.
Identifiers: MS222, LD50, Learning rate, Conditioning experiments, Bioaccumulation.

Rainbow trout (Salmo gairdneri) were force fed, with and without M.S. 222 anesthesia, pellets containing DDT equivalent to 0, 10 and 100% of the 96-h LD50 dose of 0.03 mg DDT/g body weight. DDT at the LD50 dose significantly increased learning rate 48 and 72 h after treatment. Although the 10% LD50 group did not learn significantly faster than controls, their slightly improved learning rate indicated a dose-dependent response curve. M.S. 222 did not affect learning rate of a simple conditioned response whether or not the anesthetic was combined with DDT. (Katz)

**TOXAPHENE EFFECTS ON GROWTH AND BONE COMPOSITION OF FATHEAD MINNOWS, PIMEPHALES PROMELAS,**
Fish and Wildlife Service, Columbia, Mo. Fish Pesticide Research Lab.
P. M. Mehrle, and F. L. Mayer, Jr.
Journal of the Fisheries Research Board of Canada, Vol 32, No 5, p 593-598, May 1975. 1 fig, 1 tab, 23 ref.

Descriptors: Marine fish, *Minnows, *Fish physiology, *Bioassay, *Metabolism, *Growth rates, *Toxicity, *Halogenated pesticides, *Chlorinated hydrocarbon, Laboratory tests, Water pollution effects, Insecticides.
Identifiers: *Fathead minnows, Pimephales promelas, Tissue analysis, Bioaccumulation, *Toxaphene, *Organochlorine insecticides.

Fathead minnows *Pimephales promelas) were exposed to toxaphene (55-1230 ng/liter) in a flow through diluter system for 150 days. Growth was not affected by toxaphene for up to 90 days of exposure, but within 150 days it was significantly reduced at all concentrations. Collagen content of the backbone was decreased ($P < 0.05$), amino acid composition was changed, and calcium concentration was increased. Results suggest that toxaphene altered the development and quality of the backbone, and induced biochemical manifestations of the 'broken-back' syndrome. (Katz)

**IMPACT OF THERMAL EFFLUENT FROM STEAM-ELECTRIC STATION ON A MARSHLAND NURSERY AREA DURING THE HOT SEASON,**
Florida Univ. at Marineland, St. Augustine. C.V. Whitney Marine Lab.
W. E. S. Carr, and J. T. Giesel.
Fishery Bulletin, Vol 73, No 1, p 67-80, January 1975. 6 fig, 5 tab, 14 ref.

Descriptors: Effluents, Freshwater fish, *Bioassay, *Water pollution effects, *Thermal powerplants, *Seasonal, *Summer, *Marshes, Temperature, Laboratory tests, Environmental effects, *Thermal pollution.
Identifiers: *Steam-electric plants, Mullet, Silverside, Spot, Atlantic menhaden, Silver perch, Atlantic tread herring, Mugil curema, Mugil cephalus.

Fish were collected during the hot season from three similar marshland creeks situated at various distances from a steam-electric station and analyzed for species composition and for density and biomass per unit area. 48 species were identified. In the thermally affected creeks, both the numbers and biomass of juveniles were 3-10 fold smaller than those obtained from the creek at ambient temperature. (Katz)

**STUDIES ON TOXICITY OF SODIUM NIFURSTYRENATE (NFS-NA) IN CULTURED YELLOWTAIL (IN JAPANESE),**
Nagasaki Univ. (Japan).
T. S. Ishihara, S. Kashiwagi, and M. Yasuda.
Bulletin of the Faculty of Fisheries on Nagasaki University, No 37, p 17-22, August 1974. 5 fig, 4 tab, 10 ref. (English abstract).

Descriptors: *Fish, *Fish physiology, *Fish diseases, *Toxicity, *Organic compounds, Mortality, Aquaculture, Fish farming, Environmental effects, Water pollution effects.
Identifiers: *Yellowtail, *Sodium nifurstyrenate, NFS-Na, Bioaccumulation, Bacterial pseudotuberculosis, Pasteurella piscicida.

Bacterial pseudotuberculosis, caused by pasteurella piscicida was associated with serious mortality of cultured young yellowtail during the summer months in many yellowtail farms. Sodium nifurstyrenate (NFS-Na) was effective against the pathenogenic organism. Determination of long-term toxicity of NFS-Na was sought. (Katz)

**UTILIZATION OF STREAM-BORNE PHOSPHORUS BY CAYUGA LAKE PHYTOPLANKTON,**
New York State Coll. of Agriculture and Life Sciences, Ithaca, N.Y. Ecology and Systematics Section.
J. P. Barlow.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-244 714, $3.25 in paper copy, $2.25 in microfiche. Research Project Technical Completion Report. Cornell University Water Resources and Marine Sciences Center, August 1975. 7 p, 8 ref. OWRT A-053-NY(1). 14-31-0001-5032.

Descriptors: *Lakes, *Streams, *Phosphorus, *Phytoplankton, Ecosystems, Biota, Bioassay, Tributaries, Management, Runoff, Flow, Measurement, Sampling, Estimating, Surveys, Research, Photosynthesis, Temperature, Mixing, *New York, Eutrophication, Water pollution effects.
Identifiers: *Cayuga Lake(NY), Rainstorms, Transparency, *Salmon Creek(NY).

Studies indicate that in the tributaries to Cayuga Lake, most of the phosphorus discharged is in the particulate form, during periods of high runoff. The effect of stream-borne phosphorus on lake ecosystems on whether it can be utilized by lake biota. For efficient lake management, a better understanding of the availability of phosphorus and its rate of introduction into lakes by streams is needed. Discussed are studies made to determine how much of the phosphorus introduced into Cayuga Lake by streams is available to phytoplankton. Salmon Creek was chosen for the initial studies; it supplies about 10% of the phosphorus input to the lake and is close to shore facilities at Portland Point. All observations were made just after rainstorms. Observed were changes in abundance and rates of photosynthesis of lake communities supplied with phosphorus in various forms. 'Batch' cultures to estimate relative availability of phosphorus in stream water and continuous flow experiments to determine rates of utilization were used. Bioassay techniques are useful for determining potential utilization of allochthonous phosphorus by lake phytoplankton. The difference in composition of stream and lake water offers an excellent opportunity to make quantitative studies of the fate of stream phosphorus in the lake. (Bell-Cornell)

**ADAPTATION OF COPEPOD POPULATIONS TO THERMAL STRESS,**
Maryland Univ., Catonsville. Div. of Biological Sciences.
B. P. Bradley.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-244 706, $3.75 in paper copy, $2.25 in microfiche. Maryland Water Resources Research Center, College Park, Technical Report No 34, (1975). 16 p, 6 tab, 9 ref. OWRT A-027-MD(1). 14-31-0001-5020.

Descriptors: *Copepods, *Thermal stress, *Adaptation, Temperature, *Salinity, *Thermal pollution, Water pollution effects.
Identifiers: *Eurytemora affinis, Acclimation, *Temperature tolerance.

The range of temperatures tolerated by the copepod Eurytemora affinis was found to increase with increasing salinity and with temperature acclimation. Developmental temperature also had a positive influence, as did sex, at least at higher acclimation temperatures. The effects of salinity and acclimation were independent. Female adults were equally or more tolerant than males and pre-adult stages were significantly ($P < .01$) more tolerant than adults. Thus, the range of successful reproduction, and so survival, probably depends on the tolerance range of adults. Considerable individual flexibility, at <1 ppt and without prior acclimation, was demostrated by animals tolerating an increase in temperature from 3C to 33C in less than 2 hours. There was evidence of long-term (genetic) flexibility, which would allow the species to adapt to novel thermal environments.
W75-11046

**SURVIVAL AND GROWTH RATE OF CHANNEL CATFISH AS A FUNCTION OF DISSOLVED-OXYGEN CONCENTRATION,**
Arkansas Univ., Little Rock. Dept. of Electronics and Instrumentation.
R. W. Raible.

Available from the National Technical Information Service, Springfield, Va. 22161, as PB-244 708, $3.75 in paper copy, $2.25 in microfiche. Arkansas Water Resources Research Center, Fayettesville, Publication No 33, June 1975. 35 p, 13 fig, 7 tab, 7 ref. OWRT A-019-ARK(1), 14-31-0001-3804.

Descriptors: *Dissolved oxygen, *Growth rates, *Channel catfish, Fish farming, *Mortality, Fish management, Water pollution effects.

Channel catfish were raised in water-recirculating systems for several periods of about six months duration each. Initial stock was fingerling size fish (10 to 20 grams). At dissolved-oxygen levels below 2.5 parts per million, mortality was high. Fish raised in tanks held at dissolved-oxygen levels between 3.0 and 6.8 parts per million showed increased gains of weight for each increment of added oxygen. Weight gains were as much as 50 percent higher at 6.8 parts per million compared with weights at 3.0 parts per million. Feed conversion was good in all cases. When feeding was limited to demand, feed conversion was about the same at all oxygen levels, indicating that reduced oxygen levels resulted in reduced appetites for those fish at lower oxygen levels. The dissolved-oxygen level should be held as close to saturation as circumstances allow for maximum gain rate.

**BIOCHROME ANALYSIS AS A METHOD FOR ASSESSING PHYTOPLANKTON DYNAMICS, PHASE II,**
Arkansas Univ., Fayetteville. Dept. of Botany and Bacteriology.
R. L. Meyer.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-244 710, $4.25 in paper copy, $2.25 in microfiche. Arkansas Water Resources Research Center, Fayetteville, Publication No 32, June 1975. 58 p, 12 fig, 8 ref, 2 append. OWRT B-037-ARK(1), 14-31-0001-4060.

Descriptors: *Phytoplankton, Reservoirs, Lakes, *Arkansas, *Algae, *Chlorophyll, Effluents, Eutrophication, Ammonia, Nitrates, Phosphates, Missouri, *Temporal distribution, *Spatial distribution, Primary productivity, Land use, Water temperature, Dissolved oxygen, Silicates, Water pollution effects.
Identifiers: Beaver Lake(Ark), White River, *Biochrome analysis.

Selected chemical, physical and biological parameters were determined for a man-made lake, Beaver Lake, on the White River of Arkansas and Missouri. The research program determined the qualitative and quantitative aspects of the temporal and spatial distribution of the algal subcommunities. The epipelic, epilithic, epizooic and metaphytic subcommunities had little influence on the euplanktonic subcommunity. The relationship between the qualitative and quantitative analysis of the biochromes chlorophyll-a, -b, and -c and the phytoplankton species clustered into biochrome sets is discussed. The temporal and spatial distributional patterns of temperature, oxygen, ammonia-N, nitrate-N, orthophosphate-P and silicates are described in parallel with the biological parameters. These data are related to land use practices on the two major feeder streams. One source is influenced by agricultural runoff and the other by suburbanization plus a sewage outfall from a small city. The effect of the transition from riverine to lentic conditions are also considered. (See also W75-06073)

**A REEVALUATION OF THE COMBINED EFFECTS OF TEMPERATURE AND SALINITY ON SURVIVAL AND GROWTH OF BIVALVE LARVAE USING RESPONSE SURFACE TECHNIQUES,**
Oregon State Univ., Corvallis. School of Oceanography
R. G. Lough.
Fishery Bulletin, Vol 73, No 1, p 86-94, January 1975. 9 fig, 3 tab, 9 ref.

Descriptors: *Growth stages, *Mollusks, Aquatic animals, *Temperature, *Salinity, *Larvae, Equations, *Clams, *Oysters, Water quality, Aquaculture, Environmental effects, Water pollution effects.
Identifiers: Bivalves, Tolerance studies, Mercenaria mercenaria, Mulinia lateralis, Survival rates, Sublethal limits.

The combined effects of temperature and salinity on larval survival and growth of Crassostrea virginica, Mercenaria mercenaria and Mulinia lateralis as reported in the literature were critically examined using response surface techniques. The late veliger larvae generally have a greater tolerance to both temperature and salinity than the developing embryos. Each species shows its own characteristic change in temperature-salinity tolerance as it develops and approaches the range normally tolerated by adults as it matures. Maximum growth of the veliger larvae required higher temperatures and somewhat higher salinities than maximum survival. Differences in temperature-salinity ranges estimated for maximum survival and growth were significantly different for all three species. In each case growth showed a significant temperature-salinity interaction. Response surface plots are given for early larvae survival and late veliger survival and growth. Inferences of tolerance studies are made to the fields of pollution and aquaculture. (Katz)

**A COMPARISON OF EFFECTS OF ELEVATED TEMPERATURE VERSUS TEMPERATURE FLUCTUATIONS ON REEF CORALS AT KAHE POINT, OAHU,**
Hawaiian Electric Co., Inc., Honolulu. Environmental Dept.
S. J. Coles.
Pacific Science, Vol 29, No 1, p 15-18, January 1975. 2 fig, 2 ref.

Descriptors: *Electric generators, *Temperature, *Thermal pollution, *Coral, Marine animals, Discharge(Water), Water pollution effects, Environmental effects, Mortality, Lethal limit, Monitoring.
Identifiers: *Pocillopora meandrina, Sublethal effects.

Bottom temperature and the condition of live corals in the vicinity of the discharge plume from an electric generating station were monitored. Mortality to Pocillopora meandrina was no greater under conditions of maximum thermal enrichment near the living reef fringe in the discharge area (1-2 m depth) than in an area (4-5m depth) more distant from the discharge. Although bottom temperatures in the discharge area continually varied 3-4 degrees within minute periods during every low tide, live corals seldom encountered temperatures exceeding 31 degrees C. The limited damage indicated that upper absolute temperatures are more critical in producing coral damage than are short-term temperature shocks near upper lethal limits. (Katz)

**CTS OF OIL DISPERSANTS ON THE FERTILIZATION AND DEVELOP-**
niv. (Norway). Inst. of Biology and

, and B. E. Hagstrom.
Journal of Zoology, Vol 32, No 2, p
ril 1975. 2 tab, 10 ref.

Descriptors: *Marine fish, *Marine Animals, *Animal physiology, *Fish physiology, *Embryonic growth stage, *Fish eggs, Oil wastes, Environmental effects, Water pollution effects, Laboratory tests, Microscopy, Mortality.
Identifiers: *Sea urchins, *Oil dispersants, Strongylocentrotus draebachiensis, Strongylocentrotus pallidus, Gradus morrhua, Pleuronectes platessa, *Fertilization, *Gametes, Embryogenesis, Bioaccumulation.

The effects of oil dispersants were tested on larvae from sea urchins (Strongylocentrotus droebachiensis and S. pallidus) and marine fishes (Gadus morrhua and Pleuronectes platessa). The substances used were: BP1100, BP1100X, Corexit 8666, Corexit 7664, Dasic slickgone LT 2, Emulsol/Isopar M, Emulsol with Shellsol, Finasol OSR-2, and Superb Universal Cleaner. All substances affected the fertilization of the sea urchins negatively, and during development inhibition of skeleton and endoderm was often registered. Both in larvae from sea urchins and fishes some substances caused pathological larvae and rapid cytolysis. (Katz)

**SOUTH AFRICAN EUTROPHICATION PROBLEMS: A PERSPECTIVE,**
National Inst. for Water Research, Pretoria (South Africa).
D. F. Toerien.
Water Pollution Contol, Vol 74, No 2, p 134-142, 1975. 2 fig, 7 tab.

Descriptors: *Eutrophication, Water pollution sources, Nutrient removal, Municipal wastes, Phosphorus, Aquatic algae, Oligotrophy, Nutrients, Industrial wastes, Africa, Impoundments.
Identifiers: *South Africa.

The problem of eutrophication in South Africa is discussed in terms of the nature and prevention of the problem, the restoration of eutrophic impoundments, present and future levels of eutrophication in South African waters, and a comparison of two South African impoundments. The following conclusions were made: eutrophication is a danger to the water quality of South African impoundments; the extent of this danger must be determined; most impoundments in South Africa are still oligotrophic; the eutrophic impoundments are those which receive effluents from urban-industrial complexes; phosphorus is presently the most important algal growth-limiting nutrient; oligotrophic conditions were found to exist below 30 microg-P/liter and eutrophic conditions above 75 microg-P/liter; the range of eutrophication problems already experienced include problems in water treatment, aesthetics, recreation, water weeds, livestock losses, tastes, and odors; the population and per capita were consumption increases expected will lead to more effluents reaching impoundments and to more eutrophication problems unless corrective measures are taken; eutrophication problems have a complex nature and their control is intimately associated with nutrient addition and economics; prevention of eutrophication problems can only be effected through the prevention of enrichment; successful prevention requires detailed knowledge of the specific impoundments under consideration; and, decisions to restore eutrophic lakes depend on many factors such as the uses of the water and the financial implication of restoration techniques. **BIOMAGNIFICATION OF DIELDRIN RESIDUES BY FOOD CHAIN TRANSFER FROM CLAMS TO BLUE CRABS UNDER CONTROLLLED CONDITIONS,**
Texas A and M Univ., College Station. Dept. of Biochemistry and Biophysics.
S. R. Petrocelli, J. W. Anderson, and A. R. Hanks.
Bulletin of Environmental Contamination and Toxicology. Vol 13, No 1, p 108-116, January 1975. 1 fig, 3 tab, 27 ref.

Descriptors: *Mollusks, *Clams, Crustaceans, *Crabs, *Dieldrin, *Chlorinated hydrocarbon, Pesticides, *Food chains, *Bioassay, Design, Estuaries, Laboratory tests, Environmental effects, Pesticide residues, Water pollution effects.
Identifiers: Rangia, Callinectes, *Blue crab, Biomagnification, Bioaccumulation, Tissue analysis.

The possibility of biological magnification of dieldrin residues in a two-part food chain consisting of clams, Rangia, and blue crabs, Callinectes, was tested. Clams with dieldrin concentrations of 193 and 181 micro-g/kg were fed to the crabs. Crabs incorporated 47%-78% of the dieldrin and concentrated dieldrin residues to 4.7 and 6.8 times the daily dose after 10 days of feeding. Implications of the magnification of organochlorine insecticide residues were discussed. (Katz)

**THE EFFECTS OF EX... BLACKFLY (DIPTERA: SIMU... VICIDING WITH ABATE, DURSBAN AND METHOXYCHLOR ON STREAM INVERTEBRATES,**
Waterloo Univ. (Ontario). Dept. of Biology.
R. R. Wallace, A. S. West, A. E. R. Downe, and H. B. N. Hynes.
Can Entomol, Vol 105, No 6, p 817-831, 1973. Illus.

Descriptors: *Diptera, Invertebrates, Water pollution effects, *Larvicides, Aquatic insects, Ecology, *Insecticides, Aquatic drift, Sampling.
Identifiers: *Abate, *Blackfly, *Dursban, *Methoxychlor, Simuliidae.

The effects of Abate, Dursban, and Methoxychlor and their diluents on blackfly larvae and on 'non-

target' stream invertebrates were evaluated by means of cone, rock, Surber, and drift samples. Blackfly larvae were found in many post-treatment Surber samples, although concurrent cone and rock samples often indicated that blackfly larvae were either greatly reduced in numbers or eradicated from the streams. The insecticide diluents (heavy aromatic naphtha and fuel oil) caused detachment of blackfly larvae from cones, but less than that obtained when insecticide was added. The heavy post-treatment drift of 'non-target' invertebrates in treated streams was indicative of a considerable disturbance to the aquatic invertebrate community. However, post-treatment samples indicated that the 'non-target' organisms studied were not eradicated from the streams. There were several indications that the catch of invertebrate drift was altered by pools, which possibly exerted a delaying action on drifters in the treated streams. Most of the drifting invertebrates found in post-treatment drift nets were dead.--Copyright 1974, Biological Abstracts, Inc.

Descriptors: *Marine microorganisms, *Zooplankton, *Pacific Ocean, *Ammonia, *Nitrogen, Primary productivity, Shallow water, Plankton, Jelly fish, Columbia River, Nitrates, Oceans, *Washington, *Oregon, Coasts, Upwelling, Entrainment.
Identifiers: *Ammonia excretion, Nutrient sources.

To understand biological processes in relation to environmental factors, ammonia excretion by zooplankton was studied off the coasts of Washington and Oregon. Ammonia excretion rates off these coasts varied from 0.16-0.60 micrograms of ammonia nitrogen per mg dry weight/day for planktonic animals and 0.02 to 0.06 for jellyfish. The effect of size of the various species was not observed. Seawater ammonia concentration was low in offshore regions. In the Columbia River plume offshore, excreted ammonia accounted for about 90% of the total nitrogen requirements for observed primary productivity in the summer. Ammonia excreted by zooplankton in the upper oceanic waters contributed about 36% of the total nitrogen requirements of primary production. In inshore waters, nitrogenous excretion by zooplankton was relatively unimportant. Replenishment of nitrogenous sources in surface layers of inshore waters was greatly enhanced by river-induced entrainment and wind-induced upwelling of deeper water. (Buchanan-Davidson--Wisconsin)

Descriptors: *Dissolved solids, *Organic matter, *Lakes, *Metabolism, *Michigan, *Eutrophication, Cycling nutrients, Organic compounds, Nutrient requirements, Chemical analysis, Phytoplankton, Sessile algae, Nitrogen cycle, Carbon cycle, Inorganic compounds, Bacteria, Chelation, Growth rates, Sediments, Littoral, Photosynthesis, Productivity, Decomposing organic matter, Inflow, Deep water, Detritus, Trophic level.
Identifiers: *Lawrence Lake(Mich).

This annual report describes investigations on qualitative and quantitative cycling of particulate and dissolved organic matter in lakes. Interactions of dissolved organic matter with inorganic nutrient cycling and regulation of the metabolism of micro- and macroflora were studied. Sources, fates, pathways, and interactions of dissolved organic matter in inorganic chemical cycling, allochthonous sources, metabolism, and inputs to lake systems of increasing stages of eutrophication as related to nutrient physiology and metabolism of phytoplankton, sessile algae, macrophytes, and bacteria were studied. Regulatory mechanisms of growth and rates of carbon recycling were evaluated by studying quantitative control mechanisms among microflora of pelagial zones of lakes of progressively greater eutrophy, littoral photosynthetic producer-decomposer complex, and allochthonous inorganic-organic influxes and their biotic processing. Quantification of the dynamic carbon fluxes among these components and their rate control mechanisms was fundamental to the elucidation of the rate functions of lake eutrophication. A functional detrital carbon budget was evaluated for an oligotrophic lake (Lawrence Lake, Michigan) and is being extended to more productive lakes. The fate and mechanisms regulating the qualitative and quantitative utilization and losses of organic carbon are being studied. (Buchanan-Davidson--Wisconsin)

**INVESTIGATION OF THE INFLUENCE OF THERMAL DISCHARGE FROM A LARGE ELECTRIC POWER STATION ON THE TEMPERATURE AND NEAR-SHORE CIRCULATION OF LAKE MICHIGAN,**
Wisconsin Univ., Milwaukee. Center for Great Lakes Studies.
C. H. Mortimer, and G. K. Sato.
Available from the National Technical Information Service, Springfield, Va 22161 as COO 2158-9, $4.00 in paper copy, $2.25 in microfiche. Progress Report COO-2158-9, July 1973-September 1973. 4 p, 1 fig, AEC AT(11-1)2158.

Descriptors: *Lake Michigan, *On-site data collections, Technology, *Thermal pollution, Water circulation, Electric powerplants, *Wisconsin, Heated water, Water temperature, Wind velocity, Anemometers, Currents(Water), Current meters, Histograms.
Identifiers: *Oak Creek Power Plant(Wis).

This quarterly progress report on nearshore circulation of Lake Michigan near the Oak Creek Power Plant, Oak Creek, Wisconsin presents information on data obtained from current meters and wind data obtained from anemometers at the Milwaukee Airport and at the power plant. The data is being processed, analyzed, and compared with previous data. Progressive vector diagrams will be made to provide information on the characteristics of nearshore circulation. Instead of developing histograms of current direction and speed, a computer program will be developed to compute vector frequency plots. These plots will combine speed and direction frequencies into one diagram and indicate dominant speeds and directions. Difficulties concerning the premature release of current meters and their defective recording are being investigated. (Buchanan-Davidson--Wisconsin)

**THE ROLE OF PLANKTONIC PROTOZOA IN THE MARINE FOOD CHAIN. SEASONAL CHANGES, RELATIVE ABUNDANCE, AND CELL SIZE DISTRIBUTION OF TINTINNIDA,**
New York Aquarium, Brooklyn. Osborn Labs. of Marine Sciences.
K. Gold.
Available from the National Technical Information Service, Springfield, Va 22161 as COO-3390-7, $4.00 in paper copy, $2.25 in microfiche. Progress Report COO-3390-7, May 1972-April 1973. 21 p, 17 fig. AEC AT(11-1)3390.

Descriptors: *Biological communities, *Marine microorganisms, *Protozoa, *Systematics, Dimensions, Sea water, Neritic, Cultures, Invertebrates, Surf, Measurement, Coasts, Diet, Growth rates, Seasonal, Water temperature, *New York.
Identifiers: *Tintinnida, Codonella acuta, Stenosemella oliva, Tintinnopsis beroidea, Tintinnopsis tubulosa, Coney Island(NY), Eurythermic organisms.

Tintinnida species identified in the winter-spring plankton community collected beyond the surf zone near Brooklyn, New York, were Codonella acuta, Stenosemella oliva, Tintinnopsis beroidea, and T. tubulosa, in order of relative abundance. Plots of species lorica length and width showed variability in species size. In February the Codonella population increased and in April the dimensions were more variable. The width dimension was a better guide to speciation than length: length:width ratio. Length was an excellent guide to cell growth and division. During winter T. tubulosa was actively growing with both juvenile and older forms but in April no juvenile forms were present. Time of exposure to elevated temperature had little effect on size distribution of T. tubulosa. Casting off empty loricas was independent of temperature and cell age. When T. beroidea and T. tubulosa were grown in culture, growth was proportional to amount of phytoflagellate food and was affected by diatom flora present; neither biotic or predatory effects were observed between the species. Food requirements increased at

C cell yield declined; T. tubulosa could not
and the grazing pressure of Strobilidium.

iocide effects on aquatic environment
studied and safety and environmental
onsidered in pesticide selection. No re-
aquatic herbicide meets criteria for all
as been labeled with residue to tolerance
water, fish, or shellfish. The fate of herbi-
cide residues and effects on fish, fish-food organisms, and other aquatic organisms must be ascertained. Residue toxicities of different 2,4-D esters on various fish differ. The butoxyethanol ester of 2,4-dichlorophenoxyacetic acid (2,4-D BEE) was only present in fish livers; other organs contained 2,4-D acid. Excretion occurred via the kidneys and gills. High tissue 2,4-D BEE residues tranquilized fish. Hydrolysis of 2,4-D BEE in water was rapidly accelerated by the presence of fish. Basic research on the effects of weed control methods on plant nutrients and energy in aquatic ecosystems and selective use of biocides to maximize fish yields is needed. Effects of fish toxicants, insecticides, and herbicides have been studied. Pesticides must be adequately labeled, screened, and evaluated. Cost-benefit aspects of pesticide use must include analysis of energy flow limiting factors and biomass produced at each trophic level with respect to the species managed. **PRIMARY PRODUCTION IN LAKES ONTARIO AND ERIE: A COMPARATIVE STUDY,**
Canada Centre for Inland Waters, Burlington (Ontario).
W. A. Glooschenko, J. E. Moore, M. Munawar, and R. A. Vollenweider.
Journal of the Fisheries Research Board of Canada, Vol 31, No 3, p 253-263, 1974. 10 fig, 2 tab, 19 ref.

Descriptors: *Lake Ontario, *Lake Erie, *Great Lakes, *Primary productivity, Photosynthesis, Measurement, Ecological distribution, Spatial distribution, Temporal distribution, Carbon, Trophic level, Eutrophication, Seasonal, Annual succession, Fluctuations, Chlorophyll.

A study of temporal and spatial variations in primary production in Lakes Erie and Ontario is described. Surface and integral measurements using C14 were used to compare productivity in terms of trophic status. Lake Ontario primary production was low in winter, reached a maximum in midspring, declined in summer, and increased in fall. Inshore water production rate increased more in spring and early summer, with a greater maximum reached earlier than in offshore waters. Assimilation numbers (mg C fixed/mg chlorophyll-a per hour) had a yearly range of 1.2-1.6. Primary production in both lakes showed a linear relationship to chlorophyll-a. Lake Erie primary production varied; the Eastern Basin production was highest in spring, declined in midsummer, and increased slightly in fall; the Western Basin had a midsummer maximum; and the Central Basin had peaks in late summer and early fall. Assimilation numbers showed a westerly increase. Surface production was equal in both lakes until early summer and in November-December, but integral photosynthesis was higher in Lake Ontario. Lake Erie summer production was higher. From April-December the total estimated yield for Lake Ontario was 170 g C/sq m and for the Lake Erie basins, 160, 210, and 310 g C/sq m. (Buchanan-Davidson--Wisconsin)

**MICROBIOLOGICAL EXAMINATION OF OFFSHORE LAKE ERIE SEDIMENTS,**
Canada Centre for Inland Waters, Burlington (Ontario).
B. J. Dutka, J. B. Bell, and D. L. S. Liu.
Journal of the Fisheries Research Board of Canada, Vol 31, No 3, p 299-308, 1974. 5 fig, 2 tab, 30 ref.

Descriptors: *Microorganisms, *Lake Erie, *Lake sediments, Cores, Bacteria, Oxygen demand, Great Lakes, Distribution patterns, Oxidation-reduction potential, Microbiology.

Bacterial distribution and density were studied in sediment cores of the Central and Western Basins of Lake Erie. Eh values indicated cores were devoid of oxygen and oxygen uptake rates differed between the Central and Western Basin sediments. The biological oxygen demand in surface sediments was 75% and in the lower sediments, 11-45%. Heterotrophic bacteria concentrations were proportional to available organic matter and reflected the number of heterotrophs surviving by facultative mechanisms in a deoxygenated environment. Sulfate reducing bacteria were constant through the core. Large organic sulfur reducing populations indicated an organic matter supply. Sulfur oxidizing bacteria were high in the top three cm. Densities of nitrogen cycle bacteria at sediment-water interfaces were similar at both basins but ammonifying and denitrifying bacteria in lower core layers varied. Nitrifying bacteria were found throughout the cores. Phosphate solubilizing bacteria were high in the top 5-6 cm and decreased below 10 cm. Iron and manganese oxidizing bacteria were low in deeper sediments. Overlying waters contained fewer bacteria than those in surface sediments. Offshore sediments not directly influenced by land inputs contained similar homogeneously distributed bacterial populations which varied little between surface sediment and the 5 cm level. (Buchanan-Davidson--Wisconsin)

**ALGAE IN BALTIMORE'S RESERVOIRS,**
Baltimore City Dept. of Public Works, Md. Water Supply Treatment and Pumping Div.
J. A. Valcik.
Journal of the American Water Works Association, Vol 67, No 3, p 109-113, 1975. 2 fig, 12 ref.

Descriptors: *Water treatment, *Algae, *Reservoirs, *Nuisance algae, *Maryland, Agricultural runoff, Chlorides, Nitrates, Runoff, Hydrogen ion concentration, Water pollution sources, Industrial wastes, Odor, Water costs, Municipal wastes, Potable water, Chlorella, Color, Land use, State jurisdiction, Legislation, Diatoms, Chlorophyta, Cyanophyta, Eutrophication.
Identifiers: *Baltimore(Md), Loch Raven Reservoir(Md), Prettyboy Reservoir(Md).

Reservoirs supplying water for Baltimore, Maryland experience problems related to seasonal occurrences of nuisance algae. Surveys in 1970-1971 showed that most of the pollution then was the result of poor agricultural practices; industrial and domestic waste water effluents were secondary nutrient sources. Water in the Montebello Filter Plant gradually deteriorated, and in 1974 a serious algal problem was observed in raw water entering the plant. Chlorella predominated, followed by Oocystis, and a greenish-yellow color was present in sedimentation basin effluents. A green algal bloom occurred in the Loch Raven Reservoir. Seasonal application of an algicide, reservoir aeration, use of a coagulant, and activated carbon were considered as treatment measures. Algal blooms were observed in the Liberty Reservoir in the 1960's, and diatoms caused reductions in the filter-run times of the Ashburton Filter Plant in 1967-1968. Similar problems are expected to increase in the future. Correctional treatment is costly. State and local agencies must cooperate to limit discharges of nutrient wastes into watersheds by legislative control of land usage and land management practices to limit discharges of nutrient wastes into the watersheds. **APPLICATION OF THE MANOMETRIC TECHNIQUE IN THE STUDY OF SEDIMENT OXYGEN DEPLETION,**
Canada Centre for Inland Waters, Burlington (Ontario).
D. Liu.
Canadian Research and Development, Vol 6, No 2, p 35-37, 1973. 6 fig, 1 tab, 10 ref.

Descriptors: *Analytical techniques, *Manometers, *Bottom sediments, *Oxygen sag, *Oxygen demand, Hypolimnion, Measurement, Anaerobic conditions, Biochemical oxygen demand, Chemical oxygen demand, Carbohydrates, *Lake sediments, Lake Erie, Lake Ontario.

The results of the manometric technique used in oxygen budget research are described. In addition to showing the rate and extent of oxygen consumption, the effects of other environmental conditions, such as temperature, pH, etc., may also be ascertained. This technique was used to study Lakes Erie and Ontario sediments with regard to the profile of oxygen consumption in the sediment column, the differential of the biological oxygen consumption from the chemical oxidative process by the use of a metabolic inhibitor, and the correlation between carbohydrate content and the community respiration rate. A Gilson differential respirometer was used to study the profile of oxygen consumption in lake sediment to a depth of 20 cm below the water-mud interface. The high sensitivity of the manometric method (it will detect changes of 20 microgram oxygen) has an overwhelming advantage over the conventional titration method. But application to a real lake system depends on the solution of the problem of how to reproduce the lake mixing processes in the laboratory. Shaking or disturbance greatly increases the lake sediments' oxygen consumption rate, therefore caution must be exercised when considering plans to use mechanical dredging for the removal of polluted sediment from Lake Erie. (Auen-Wisconsin)

**THE EFFECTS OF THE FORMATION OF LAKE KAINJI (NIGERIA) UPON THE INDIGENOUS FISH POPULATION,**
Ife Univ. (Nigeria). Kainji Dam Research Project.
D. S. C. Lewis.
Hydrobiologia, Vol 45, No 2/3, p 281-301, 1974. 3 fig, 18 ref.

Descriptors: *Fish populations, *Africa, *Post-impoundment, *Environmental effects, Reservoirs, Fish food organisms, Rivers, Succession, Prey fish, Herbivores, Bottom fish, Fish establishment, Fish types, Detritus, Omnivores, Carnivores.
Identifiers: *Nigeria, *Lake Kainji(Nigeria), River Niger(Nigeria), Isectivores.

Closure of Kainji Dam resulted in conversion of 137 kilometers of the River Niger into Kainji Lake, thus transforming a fluvatile environment into a lacustrine environment. When reactions of each component of the fish population to the environmental transition were studied, profound changes in the relative abundance of many species were observed. The immediate changes were a decline in Mormyridae numbers, increases in numbers of Citharinidae (especially Citharinus citharus), Characidae (especially Hydrocynus forskali and Alestes baremose), Schilbeidae (especially Eutropius niloticus), and Lates niloticus; and a change in the relative abundance of various species of Mochochidae. After the lake had been in existence for a year, further recorded changes included a decline in numbers of Citharinidae (especially Citharinus citharus) and Lates niloticus, and increases in Characidae, Cichlidae (especially Tilapia galilaea), and clupeids. Overall population trends resulting from the lake's formation showed a decline in the number of bottom feeding insectivores, increase in the number of detritus feeders immediately after the lake was formed, followed by a decline; and an increase in numbers of planktivores, omnivores, and carnivores. The population changes had a number of features common to changes which occurred in other African man-made lakes. (Buchanan-Davidson--Wisconsin)

**ACID STRIP MINE LAKE RECOVERY,**
Missouri Univ., Columbia. Dept. of Civil Engineering.
D. L. King, J. J. Simmler, C. S. Decker, and C. W. Ong.
Journal Water Pollution Control Federation, Vol 46, No 1, p 2301-2315, 1974. 11 fig, 1 tab, 20 ref. OWRT A-038-MO(3).

Descriptors: *Strip mine lakes, *Neutralization, *Coal mine wastes, Productivity, Hydrogen ion concentration, Chemical reactions, Pyrite, Waste water treatment, Reduction(Chemical), Acid mine water, Mine acids, Clay minerals, Bacteria, Sulfur bacteria, Aluminum, Alkalinity, Bicarbonates, Vegetation effects, Nutrients, Reclamation, Organic matter, Hydrogen sulfide.
Identifiers: *Lake rehabilitation.

Acid strip mine lakes formed by oxidation of iron-sulfur pyrites and marcasites left on the surface after coal removal can be made alkaline and support aquatic communities. Factors aiding this recovery process are clay minerals, reaction with alkali metal compounds, activity of sulfate-reducing bacteria, creation of anaerobic conditions, reducing conditions, depth of water, light, aluminum concentration, and formation of bicarbonate alkalinity. The amount of vegetated land near the lake, seasonal changes in temperature, wind-induced mixing, time, bacteria, and algal nutrients are also important. Recovery can be accelerated by the addition of organic matter. The carbon:nitrogen:phosphate ratio should be considered in choosing the organic material to be used. The advantages of accelerating the recovery process would be elevation of pH, loss of acidity and metals, and use of organic wastes. The major disadvantage is evolution of hydrogen sulfide, which may be controlled by limiting the amount of organic matter added to the lake. The recovered strip mine lake will be in an early eutrophic state. The biological, chemical, and physical interaction from acid formation to a recovered lake could be avoided by covering acid-producing materials with non-acid soil when coal is strip-mined. (Buchanan-Davidson--Wisconsin)

**THE GROWTH OF SOME EPIPHYTIC ALGAE IN A LAKE RECEIVING THERMAL EFFLUENT,**
Alberta Univ., Edmonton. Dept. of Botany.
M. Hickman, and D. M. Klarer.
Archiv fur Hydrobiologie, Vol 74, No 3, p 403-426, 1974. 12 fig, 2 tab, 44 ref.

Descriptors: *Periphyton, *Algae, *Lakes, *Thermal pollution, *Canada, Bulrushes, Water temperature, Growth rates, Period of growth, Powerplants, Seasonal, Light intensity, Nutrients.
Identifiers: *Lake Wabamun(Alberta), Achnanthes minutissima, Oedogonium, Spirogyra, Gomphonema parvulum, Diatoma elongatum, Fragilaria capucina, Fragilaria vaucheriae, Stigeoclonium tenue, Cocconeis placentula, Gomphonema gracile, Epithemia turgida, Mougeotia.

Discharge of heated water into Lake Wabamun, Alberta, caused changes in the standing crop size of epiphyton associated with Scirpus validus and in the algal species composition. Seasonal growth cycles of twelve dominant species of epiphytic algae were studied using cell count data to determine effects of inflow of heated water on their growth. During winter in the heated areas nitrate-nitrogen, phosphate-phosphorus, and dissolved silica concentrations increased, reaching maximum levels in the spring, then decreased during ice break-up. The longer growing season was responsible for the early development and early spring maxima of Achnanthes minutissima, Oedogonium, Spirogyra, Gomphonema parvulum, Diatoma elongatum, Fragilaria capucina, and F. vaucheriae; extending autumn maximum of Stigeoclonium tunue into winter; and presence of large populations of Cocconeis placentula and Gomphonema gracile from autumn through winter. Heated water adversely affected growth of Epithemia turgida and Mougeotia and benefited growth of Spirogyra and Stigeoclonium tenue. Temperature alone did not account for all the differences when growth in heated and non-heated areas was compared; factors such as light intensity, daylength, and inorganic and organic nutrients in the water were also important. (Buchanan-Davidson--Wisconsin)
W75-11225

**IN SITU MEASUREMENT OF THE SETTLING VELOCITY PROFILE OF PARTICULATE ORGANIC CARBON IN LAKE ONTARIO,**
Canada Centre for Inland Waters, Burlington (Ontario).
N. M. Burns, and A. E. Pashley.
Journal of the Fisheries Research Board of Canada, Vol 31, No 3, p 291-297, 1974. 4 fig, 2 tab, 13 ref.

Descriptors: *Phytoplankton, *Settling velocity, Laboratory equipment, Particle size, Organic compounds, Carbon, Measurement, *Lake Ontario, On-site tests, Vertical migration, Thermocline, Epilimnion, Phosphorus, Nutrients.
Identifiers: *Organic carbon.

Calm water settling velocity profiles of particulate organic matter were measured using special sampling bottles. To determine phytoplankton settling velocity under natural conditions, species, light conditions, cell concentrations, growth rate, nutrient concentrations, cell physiological state, zooplankton grazing effects, and density stratification must be considered. The sampling bottles had a horizontal dividing shutter, two triggers sensitive to small and large diameter messengers, and a vane assembly and swivel clamp which enabled it to rotate freely on the mooring line to line up with the current and suffer minimum vibration due to vortex-shedding before retrieving the bottles. Samples were subdivided into upper and lower portions so settling velocities could be calculated. The settling velocity profile of Lake Ontario varied between -0.4 and +2.0 m/day. Net settling velocities measured at the top of the thermocline were used to estimate net settling fluxes from the epilimnion; these varied between -0.074 and +0.336 millimoles phosphorus/sq m/day. Net settling flux can differ from sedimentation flux out of the epilimnion. Negative settling can add nutrients to the epilimnion during the stratified period. Settling flux and diffusion flux have similar magnitudes, occasionally acting together or in opposition. (Buchanan-Davidson--Wisconsin)

*Nucleic acids, Ribonucleic acid, nucleic acid, Ulva lactuca, Grateloupia Polysiphonia opaca.

e algae, Ulva lactuca, Grateloupia and Polysiphonia opaca, were exposed kinskaya oil and C14 labeled sodium Deoxyribonucleic acid (DNA) rom Ulva showed no substantial dif- degree of polymerization between sta- bile DNA. Activity increases in low gments indicated DNA depolymeriza- tion. Stable DNA was more resistant to oil and labile DNA more sensitive, possibly causing destruction of the mechanism of expression of heredity, synthesis of anomalous proteins, and death. Ulva DNA and RNA specific activities depended on length of exposure and oil concentration; increasing oil concentrations caused decreased specific activity. Complete inhibition of nucleic acid biosynthesis at high concentrations of oil occurred after 48-72 hours. With all algae there was simultaneous inhibition of DNA and RNA, but there were variations due to differences in their systemic positions and individual peculiarities. Oil pollution decreased RNA and DNA contents of red algae by inhibition of biosynthesis. It is concluded that the influence of oil on algae was due to modification of the degree of DNA polymerization and inhibition of DNA and RNA biosynthesis, thus reducing the nucleic acid content. **MAN'S IMPACT ON A NEWLY FORMED RESERVOIR,**
New Mexico Univ., Albuquerque. Dept. of Biology.
E. W. Hansmann, D. E. Kidd, and E. Gilbert.
Hydrobiologia, Vol 45, No 2-3, p 185-197, 1974. 6 fig, 5 tab, 9 ref. NSF GI-29422.

Descriptors: *Reservoirs, *Eutrophication, *Productivity, *Recreation, *Colorado River, Arizona, Utah, Climatic data, Geomorphology, Seasonal, Annual.
Identifiers: *Lake Powell(Ariz-Utah).

The impact of recreation on eutrophication was studied in the Lake Powell Reservoir which resulted from the Glen Canyon Dam built on the Colorado River at the Arizona-Utah border. Water quality was determined by measuring primary net productivity using C12. Recreational activities in the Wahweap area had a stimulating effect on net productivity and eutrophication of the area compared to other sites, especially during the summer season. Higher production at the Navajo site during the winter season did not appear to be related to recreational activities thus must be assumed to be due to natural unknown abiotic conditions. Lake Powell can be classified as a naturally eutrophic body of water with a mean production rate at its lower end of 645.7 mg/C12/sq m/day. It is not known if the complete Lake Powell system is naturally eutrophic or only the area under study. The results are undoubtedly an underestimation of the total carbon production of the area. Benthic primary communities have been observed in several bays and canyons and must be accounted for in analyzing the results. (Buchanan-Davidson--Wisconsin)

**EXPERIMENTALLY INCREASED FISH STOCK IN THE POND TYPE LAKE WARNIAK. IV. FEEDING OF INTRODUCED AND AUTOCHTHONOUS NON-PREDATORY FISH,**
Warsaw Univ. (Poland). Dept. of Hydrobiology.
A. Prejs.
Ekologia Polska, Vol 21, No 31, p 465-503, 1973. 8 fig, 12 tab, 81 ref.

Descriptors: *Fish management, *Fish stocking, *Fish diets, Fish food organisms, Carp, Fish populations, Spatial distribution, Competition, Herbivores, Feeding rates, Benthic fauna, Zooplankton, Aquatic plants, Europe.
Identifiers: *Lake Warniak(Poland), Bream, Roach, Tench.

Introduction of carp and bream into a shallow, eutrophic lake, the effect of the considerably increased and changed fish stock on the biocenosis of the water body, and the practical aspects of fishery management were studied. Studies on the feeding of non-predatory fish dealt with food composition of introduced fish and of dominant autochthonous non-predatory species; feeding intensity of examined species; analysis of food relations in the changed community of non-predatory fish due to introduction of new species. Carp, bream and tench feed mainly on bottom fauna and fauna associated with plants; crucian carp feed on zooplankton, and roach prefer plant food, with macrophytes the first choice. In the years of studies, together with the increase of fish stock their grazing intensity decreased and their feeding habits changed. In the year with the most numerous fish stock the introduced species (carp and bream) ate about 60% of the bottom fauna biomass and fauna associated with plants; about 30% of zooplankton biomass was consumed by the whole community of non-predatory fish. Data on the differentiation of the distribution of basic feeding grounds of particular fish species are presented. (Jones-Wisconsin)

Identifiers: *Nitella hookeri, *Rotorua Lakes(New Zealand), Thiamine, Pyridoxin, Nicotinamide, Cobalamin, Riboflavin, Biotin, Ascorbic acid, Giberellic acid, Kinetin, Indole acetic acid.

Growth of Nitella hookeri A. Br. in non-axenic cultures, with or without soil extract, is not significantly stimulated by addition of most vitamins, coenzymes, and growth hormones. Thiamine, pyridoxin, and nicotinamide increased growth slightly but only at concentrations greater than those found under field conditions. Kinetin inhibited growth. Nitella propagules are not typical adult vegetative cells in their responses but form naturally in the lakes so may indicate possible factors governing growth for certain periods of the year. The best growth measured by linear increment, dry weight, and fresh weight was at 17C; growth ceased at 10C or 25C. Growth increased with increased light intensities, but 600 lux for a 12-hour day appeared to be the best long term condition. However growth responses to varying temperature and light conditions were confused thus a more rigid growth assessment is needed. The same general trends were observed in these experiments as were observed under natural conditions in the New Zealand Rotorua Lakes and help explain the natural distribution of Nitella in these lakes. However winter growth occurs at a temperature of about 10C in these lakes, indicating that laboratory culture conditions have not defined all growth factors. (Buchanan-Davidson--Wisconsin)

**SEASONAL ABUNDANCE OF CRUSTACEAN ZOOPLANKTON AND NET PLANKTON BIOMASS OF LAKES HURON, ERIE, AND ONTARIO,**
Canada Centre for Inland Waters, Burlington (Ontario).
N. H. F. Watson, and G. F. Carpenter.
Journal of the Fisheries Research Board of Canada, Vol 31, No 3, p 309-317, 1974. 2 fig, 5 tab, 15 ref.

Descriptors: *Seasonal, *Zooplankton, *Plankton, *Biomass, *Lake Erie, *Lake Huron, *Lake Ontario, Microorganisms, Fluctuations, Spring, Summer, Autumn, Cladocera, Copepods, Phytoplankton, Dominant organisms, Crustaceans, Shallow water, Littoral, Varieties, Great Lakes, Daphnia.

Crustacean zooplankton and net plankton biomass changed from April to December in Lakes Huron, Erie, and Ontario. Species were generally identical but times of maxima and relative species composition differed. Net biomass changes were due to changes in species composition, total crustacean numbers and phytoplankton quantities. Numbers were lower in the main part of Lake Huron than Lake Ontario, but net biomass values were equal or greater than those in Lake Ontario open waters because the organisms were larger and net phytoplankton amounts differed. Crustacean concentrations and biomass were highest in inshore water in all lakes, but fluctuated more than in offshore areas, especially in Lake Huron. Fluctuations in crustacean numbers were related to seasonal cycles of cladocerans and cyclopoid which often had summer maxima. Calanoids had more stable numbers. Biomass fluctuations were related to phytoplankton blooms. Calanoid copepods were most abundant and diverse in Lakes Huron and western Lake Erie, and cyclopoids and cladocerans in Lakes Erie, Ontario, and Saginaw Bay of Lake Huron. Diacyclops bicuspidatus thomasi was the most abundant cyclopoid all year in all lakes, Tropocyclops prasinus in Lake Ontario, and Acanthocyclops vernalis in Lake Erie. Cladocerans were most numerous in Lakes Erie and Ontario. (Buchanan-Davidson--Wisconsin)

**EFFECTS OF OZONE-TREATED SEAWATER ON THE SPAWNED, FERTILIZED, MEIOTIC, AND CLEAVING EGGS OF THE COMMERCIAL AMERICAN OYSTER,**
S. A. Maclean, A. C. Longwell, and W. J. Blogoslawski.
Mutat Res, Vol 21, No 5, p 283-285, 1973.

Descriptors: Water pollution effects, *Ozone, *Oysters, Sea water, *Spawning, *Fertilization, Commercial shellfish, *Fish eggs.
Identifiers: *American oyster eggs, Crassostrea-virginica, Parthenogenesis, Protoplasm, Meiotic eggs(Oysters).

Fertilization of Crassostrea virginica eggs occurred less readily in O3 treated water, as evidenced by a decrease in polyspermy and an increase in parthenogenesis. Larger numbers of eggs retarded in their completion of meiosis were noted and there was an increased incidence of abnormal polar bodies in the ozonized water. Most prominent in the O3-treated water were the large numbers of cleaving eggs with abnormal nuclei. The decomposition of ozone in water produces the same positive radicals (OH and HO2) generally considered the biologically active products of irradiation of protoplasm and the cytological and cytogenetic effects of ozone appear radiomimetic.--Copyright 1974, Biological Abstracts, Inc.

**ACUTE TOXICITY OF PETROCHEMICAL DRILLING FLUIDS COMPONENTS AND WASTES TO FISH,**
Fisheries and Marine Service, Winnipeg (Manitoba). Resource Management Branch.
M. R. Falk, and M. J. Lawrence.
Technical Report Series No CEN-T-73-1, April, 1973, 108 p. 9 fig, 10 tab, 7 ref.

Descriptors: *Toxicity, *Drilling fluids, *Rainbow trout, Fish, Lethal limit, Pollutants, Water pollution effects, Oil fields, Oil wells, Water wells, Mud, Slurries, Wells, Bentorite, Bicarbonate, Potassium compounds, Waste disposal, Sumps, Drainage, Surface water.
Identifiers: *Lake chub(Fish), *Lignosulfate, *Barium sulfate, Waste containment.

A study conducted in 1972 consisted of a field program to acquire information on the nature and amounts of drilling fluid compounds used, the efficiency of waste containment facilities and on toxicities of drilling and sumps fluids, and a laboratory phase to determine acute toxicities of drilling fluids and their constituent chemicals. Drilling fluids were acutely toxic to lake chub and rainbow trout with 96 hour LC50's of 0.83 to 12.0 percent. Sump fluids were less toxic with one sump yielding 96 hour LC50's of 22.5 and 81.0 percent for composite and surface sump fluids, respectively. Out of 27 common components of drilling fluids, seven were toxic and six were moderately toxic. The field program was conducted in the Mackenzie delta area, Northwest Territories, Canada. Recommendations on waste containment, treatment and future studies are given. A brief description of the nature and function of drilling fluids and their constituent chemicals is also included. (Bradbeer-NWWA)

**THE TOXICITY OF DRILLING FLUID COMPONENTS TO AQUATIC BIOLOGICAL SYSTEMS, A LITERATURE REVIEW,**
Fisheries and Marine Service, Winnipeg (Manitoba).
B. Land.
Technical Report No 487, 1974. 33 p, 8 tab, 58 ref.

Descriptors: Publications, *Reviews, *Bibliographies, *Data collections, *Toxicity, *Fish, *Drilling fluid, Marine biology, Aquatic animals, Suspended solids, Suspended load, Environment, Pollution, *Water pollution effects, Surface waters.
Identifiers: Barite, Lignosulphate.

A literature review is presented on the toxicity to aquatic biological systems of drilling fluid components in northern Canada. This review includes aquatic toxicity literature that was available prior to January 31, 1974. The components of drilling fluids include suspended solids, chlorides, alkaline sources, chromium compounds, bactericides, organic polymers, dispersants, defoamers, lubricants and detergents. On the basis of quantities used and of the harmful long-term effects produced, the alkaline sources, bactericides, barium sulphate, bentonite, chromium salts and potassium chloride compromise the major sources of aquatic toxicity. **PILOT-PLANT STUDY OF DENITRIFICATI USING A SUBMERGED SAND FILTER AT R MEADS SEWAGE WORKS,**
B. Collinson.
Water Pollution Control, Vol 73, No 6, p 685-
1974. 6 fig, 3 tab, 19 ref.

Descriptors: *Waste water treatment, *Filt *Nitrates, *Sewage treatment, Effluents, plants, Runoff, *Denitrification, Anaerobic t ment, Filtration.
Identifiers: Auto analyzer, Rye Meads(Gt B Submerged sand filter.

The reduction of nitrate from all sources in River Lee at Chingford, Great Britain was vestigated. Major sources of nitrate are sewag fluent, drainage and surface runoff from agr tural land. Of the possible methods of ni reduction, removal from effluent by the add of a methanol carbon source and an anaer flooded sand filter was chosen. A pilot plant s at the Rye Meads Sewage Works used a

sand filter for sewage effluent treatment. s of amm. N, chloride, phosphate, anionic ic detergents and nitrate were made using o Analyzer. No significant differences in between the work's effluent or the ied effluent were found. Suspended solids educed from 10 mg/liter to 5 mg/liter by through the sand filter. The COD values d were used as an indication of residual ol. The methanol requirement is dependent trate concentration and continuous moni- of nirtate would be necessary for a large ant. During seven months of testing the cation unit, it was shown that 96 percent of N was removed from approximately 8000 r day of effluent with a contact period of inutes and 100 mg/liter of methanol added rbon source. The Rye Meads Works is le to denitrification using this process. plans include modification of the existing avity sand filter, enabling up to 4540 cu m per day to be denitrified. (Prague-FIRL) 955

s: Opercularia, Vorticella, Protozoa n dynamics, Blue Plains Treatment shington, DC.

was conducted to identify the dominant in the various parts of the waste water treatment processes of the Blue Plains Treatment Plant, Washington, D.C. Its second objective was to observe the dominant protozoa in the secondary effluent, within laboratory conditions simulating the plant, in order to determine whether or not the populations are influenced by environmental factors. Finally, the laboratory equipment simulating plant conditions was seeded with two peritrichs, Vorticella and Opercularia, and the common bacteria from the plant effluent; buffers and organic nutrients, sucrose and glutanic acid, were then added to determine whether these additives affected the growth of the protozoan populations. From the investigations, the relative importances of bacteria and protozoa was waste water treatment were examined. It was concluded that Vorticella, which is responsible for clarification, is dominant in secondary effluent. The death rate of Opercularia was not significantly affected by pH changes, while the Vorticella population was more sensitive to such changes. Also, when glutamic acid was added, the Opercularia population increases in number. These findings indicate that further tests should be made to determine the optimum protozoa:microorganism ratio at various substrate concentrations existing in a treatment plant. Tests are necessary to compare catalase activity with the ratio and also to determine whether the bacteria are dead or alive when they are digested by protozoa. (Prague-FIRL)

**THE MECHANISM OF FLOCCULATION PROCESSES IN THE PRESENCE OF HUMIC STUBTANCES,**
Technion - Israel Inst. of Tech., Haifa.
N. Narkis, and M. Rebhun.
Journal of the American Water Works Association, Vol 67, No 2, p 101-108, February, 1975. 8 fig, 19 ref.

Descriptors: *Organic compounds, *Flocculation, *Waste water treatment, Polyelectrolytes, Cations, Anions, Suspended solids, Biological treatment, Fulvic acids, Humic acids, Colloids, Organic acids.
Identifiers: Organo-clay complexes.

The mechanism of flocculation is detailed for a system with organic matter, particularly with clay suspensions interacting with humic and fulvic acids. A radioactively labelled cationic polyelectrolyte was used to facilitate this study. The phenomenon of flocculation is similar in any system where suspended solids interact with dissolved organic matter, such as in raw sewage or effluents from biological treatment plants. It was demonstrated that the salts of humic and fulvic acids, which are anionic polyelectrolytes, react chemically with the polycationic flocculant through carboxylate and phenolate groups and thus form colloidal-reaction-product flocculates which are removed by settling. In this case, a cationic polyelectrolyte was added to an organo-clay complex suspension dispersed in humate or fulvate solution. The polyelectrolyte was shown to react first with free humates and fulvates and only after the complete reaction with free organic acids did flocculation of the suspension occur. Because the presence of organic matter in solution or as a complex on the mineral clay particle surface inhibits the process of flocculation, large doses of the flocculant are necessary to produce reaction conditions favorable for complete reaction. (Prague-FIRL)

**OZONE TREATMENT LICKS COLOR PROBLEM.**
Water and Sewage Works, Vol 122, No 4, p 52-54, April, 1975. 3 fig.

Descriptors: *Waste water treatment, *Water supply, *Ozone, *Chlorination, *Treatment facilities, Color, Odors, Filtration.
Identifiers: *Color removal, Watchgate Treatment Works(Gt Brit), Ozonization.

The scheme of water supply treatment for the city of Manchester, England, and the Watchgate Treatment Works is described. The Works consists of Five units--control, filter, washwater, contact tank, and ozone. Basic treatment involves rapid gravity filtration, super-chlorination and contact, pH correction, and chlorine residual control of the finished waters. A basic problem in the system was color reduction, associated with removal of particulate matter and sterilization. Water from Windermere and Haweswater, two of four sources, had color up to 7 degrees and 30 degrees Hazen respectively. Required characteristics of the treated water are pH 7.5 to 8.0, color less than 5 degrees Hazen, and turbidity less than 2 ppm. To remove color from the Haweswater water, pretreatment by filtration and chlorination is followed by ozonization in three separate streams. The use of ozone is particularly suited to the limited head available throughout the plant. Ozone may also be used to sterilize Haweswater water if chlorine is not available, and to control tastes and odors when required. A plan of the Watchgate Treatment Works is detailed, whereby the ozone unit may be utilized or by-passed. The layout includes administrative offices, Laboratories, a control room, an equipment room, and chemical storage facilities; the site provides for alternative treatment methods. (Prague-FIRL)
W75-10959

**FIRST STAGE OF THE WORLD'S LARGEST PURE OXYGEN SEWAGE PLANT TO UNDERGO TEST.**
Engineering News-Record, Vol 194, No 2, p 16-17, January 9, 1975.

Descriptors: *Oxygen, *Aeration, *Sewage treatment, Pilot plants, Municipal wastes, Treatment facilities, *Waste water treatment, Michigan, Oxygen.
Identifiers: *Detroit(Mich), Hydrocarbons.

The Detroit Metro Water Department, of Detroit, Michigan, has built a 300-mgd pure oxygen treatment system for municipal wastes. A 600-mgd capacity additional facility is under construction for 1977, which will make the system the world's largest pure oxygen plant. The system was chosen on the basis of space considerations, successes with pure oxygen aeration elsewhere, and tests with a 100,000 gpd pilot plant. The new system has been tested to be capable of reducing BOD and suspended solids in effluent to 20 ppm, which is below the design goal of 30 ppm. Two identical aeration tanks were built five years ago at the projects inception, one with oxygen and one with air equipment. In July, a comparison will be made, and it is hoped that the air system will be converted to oxygen. The new installation needs only 48% of the air system's power because the partial pressure of oxygen in air is 160 mm of mercury, whereas the partial pressure of pure oxygen is 760 mm. Thus, a pure oxygen system has almost five times the internal driving force of an air system, requiring less pumps, condensers, and mixers. The system, including the Detroit plant's high-capacity final clarifiers should cut operating and capital costs by $21 per million gallon each year. Because the Detroit plant is landlocked, the sewage plant has installed deep tanks to conserve space. Other design considerations include air sampling for automatic shutdown should volatile hydrocarbons in sewage, reach 20% of their explosive limit. Further tests will demonstrate the systems operation in cold weather. (Prague-FIRL)

**SOME STUDIES ON NITRIFICATION IN THE ACTIVATED SLUDGE PROCESS,**
Sheffield Water Pollution Control Dept. (England).
I. R. Hall.
Water Pollution Control, Vol 73, No 45, p 538-547, 1974. 4 fig, 2 tab, 22 ref.

Descriptors: *Waste water treatment, *Nitrification, *Sewage treatment, Ammonia, Industrial wastes, Toxicity, Activated sludge, Hydrogen ion concentration.
Identifiers: Ammonia removal, Nitrosomonas.

Nitrification in the activated sludge plant for removing ammonia at Sheffield's Blackburn Meadows sewage works was investigated. This sewage contains about 25 percent industrial waste water, including metal finishing wastes. It was thought that nitrification would be the most economical method of removing ammonia. Results of experimental testing showed that sewage from this plant can be consistently nitrified using the activated sludge method. The rates of growth of Nitrosomonas in activated sludges grown on an industrial and domestic sewage, when ammonia was not rate-limiting, were higher than those reported elsewhere for low temperature domestic sewage. The pH value for nitrification was always above 6.3 and nitrifying activity of activated sludges was independent of pH value in the range of 7 to 9. Discussed also was a simplified method to predict whether nitrification will occur, from consideration of either sludge loading or sludge wastage. In addition, it was suggested that new discharges to sewers be screened for potential toxic hazards. (Prague-FIRL)
W75-10961

**PRESERVING ACTIVATED SLUDGE,**
Wiggins-Rimer and Associates, Durham, N.C.
J. A. Nissen, and P. A. Vesilind.
Water and Sewage Works, Vol 121, No 8, p 48-52, August, 1974. 7 fig, 5 ref.

Descriptors: *Waste water treatment, *Activated sludge, *Preservation, Analysis, Analytical techniques, Testing, Biodegradation, Sludge digestion, Microbial degradation.
Identifiers: *Formaldehyde.

Many problems result when the sludge from pilot or bench-scale experiments is transported to consultants, equipment manufactures, or commercial laboratories for analysis. A cheap, readily available method of preserving waste water sludges is needed that is capable of stopping all biological action, without changing the physical characteristics of aerobic or anaerobic sludge. The preservative agent should possess the following attributes: be able to kill the types of organisms found in biological sludge before biological action can alter the physical characteristics of the sludge; the physical structure of the cells killed should not be changed by the action of the preservative; the required dosage should not be large enough to significantly dilute the sample; the preservative should not be hazardous to humans; and, the preservative should be economical and readily available. As a result of the experiments performed, formaldehyde is considered an acceptable preservative for activated and digested sludge. Dosages sufficient to effectively kill activated sludge organisms are in the range of 0.5-1.0 percent commercial grade formaldehyde (by volume). Activated sludge which undergoes anaerobiasis and becomes anaerobic demonstrates much better settling characteristics and a lower viscosity than the fresh or preserved sludge. Digested sludge organisms were found to be sensitive to very small dosages of formaldehyde. Small dosages of formaldehyde do not significantly change the physical nature of digested sludge or interfere with the action of chemical conditioners. (Orr-FIRL)
W75-10962

**DISINFECTING WASTEWATER WITH CHLORINATION/DECHLORINATION PART 1,**
G. C. White.
Water and Sewage Works, Vol 121, No 8, p 70-71, August, 1974. 1 fig.

Descriptors: *Waste water treatment, *Chlorination, *Coliforms, *Disinfection, Chemical reactions, Mathematical models, Biochemical oxygen demand, Suspended solids, Chemistry, Potable water, Water treatment, Sewage treatment.

The disinfection of waste water is an important in waste water treatment as BOD, suspended solids, and grease removal. The chemistry of waste water chlorination is described. When a chlorine solution from a conventional gas chlorinator enters the waste water stream the reaction that takes precedence over all others is the reaction between free chlorine and ammonia nitrogen to form chloramine and water. This reaction is 99% complete in a fraction of a second at 60-65F and pH 7.5. The mechanism of disinfection is generally accepted to be penetration through the cell wall of the microorganism by the chlorine compound and a chemical reaction between the compound and the vital parts of the microorganism so that reproduction is ended. When potable water is chlorinated that contains only an excess of ammonia nitrogen, the resulting compounds are almost all monochloramines. However, if organic nitrogen is present in amounts greater than 0.15 mg/liter, dichloramine begins to form. This compound or similar compounds have a poisoning effect on chlorine residuals that are only a few minutes old and for this reason back-mixing or short circuiting in a chlorine contact chamber should be avoided. The mathematics of the most probable number (MPN) of coliform concentration from a quantitative viewpoint is presented. The following equation was developed from a pilot plant system that had excellent mixing: y=y sub o (1 + 0.23 ct) where y=MPN in chlorinated waste water at end of time t; y sub o=MPN in effluent prior to chlorination; c=total chlorine residual in mg/liter; and, t=contact time in minutes. This mathematical model illustrates the importance of waste water quality on the attainment of a low coliform concentration. (See also W75-10964) (Orr-FIRL)
W75-10963

**DISINFECTING WASTEWATER WITH CHLORINATION/DECHLORINATION PART 2,**
G. C. White.
Water and Sewage Works, Vol 121, No 9, p 93-95, September, 1974. 1 fig.

Descriptors: *Chlorination, *Disinfection, Equipment, *Wastewater treatment, *Potable water, Control, Water purification, Water treatment Sewage treatment, Water quality control.

The three major factors that account for the difference in the sensitivity between potable water and waste water to the disinfection process by chlorine are the magnitude of coliform concentration prior to chlorination, the ammonia nitrogen content, and the relatively high organic nitrogen content in waste water effluents. The most efficient chlorination disinfection systems studied had four attributes in common: very good initial mixing; sufficient contact time (at least 30 min. at peak flow) in an outfall conduit or a well designed basin; a good automatic chlorine residual control system; and, competent operating personnel. Mixing should ideally be completed in a fraction of a second. In actual operation, mixing completed within one to three seconds is considered excellent. A tubular type of reactor or a closed conduit are both good mixing devices. A chlorine contact chamber should provide sufficient residence time for the chlorine to reduce the harmful and objectionable microorganisms to acceptable levels. Closed conduits are the best contact chambers followed by long narrow outfall channels as the second best type. There are two types of chlorine residual control systems: straight residual control where the analyzer controls both the change in flow rate and chlorine demand of the waste water; measuring device and from a residual analyzer. The compound loop system is recommended because of its ability to cope with sudden changes in flow. (See also W75-10963) (Orr-FIRL)

**NITROGEN REMOVAL BY CATALYST-AID BREAKPOINT CHLORINATION.**
Environmental Quality Research and Development Unit, New York State Dept of Environmental Conservation, Albany.
W. N. Stasiuk, L. J. Hetling and W. W. Shuster.
Journal Water Pollution Control Federation, 46, No 8, p 1974-1983, 1974. 7 fig, 2 tab, 10 ref.

Descriptors: Nitrogen, *Ammonia, *Al *Chlorination, *Waste water treatment, W pollution, Nitrification, Denitrification, exchange, Oxidation, Activated carbon, Nitro compounds, Nutrient removal, Adsorption.
Identifiers: Chloramine formation, *Breakp chlorination, Air stripping, Nitrogenous oxy demand, Trichloramine, Monochloram Dichloramine, *Nitrogen removal

Under certain conditions, the removal or con sion of nitrogenous species in waste water necessary. Ammonia must be removed to a with no direct oxygen demand when amm nitrogen exerts a large drain on the oxy resources of the receiving waters. When nutrient that limits algae growth is nitro removal is needed to eliminate nuisance blooms. Methods developed for the convers reduction, or removal of ammonia nitroge waste waters include biological nitrifica denitrification, selective ion exchange, stripping at elevated pH, and breakpoint chlo tion. A technique for reducing nitrogenous oxy demand submitted to the New York State Dep ment of Environmental Conservation utilized sorption of chloramines on activated car Chloramines are formed in chlorinated waters taining ammonia and hypochlorous acid. Prev chloramine formation studies were handicap by the occurrence of decomposition reaction low, pH, as well as Cl:N ratios greater tha These consisted of the loss of oxidizing chlo and ammonia nitrogen, and are called breakp chlorination reactions. An advantage would realized if monochloramine were adsorbed on tivated carbon. The theoretical Cl:N ratio for per cent removal of ammonia would decrease 76:1 for breakpoint to approximately 5:1 for formation of monochloramine to be adsorbed the carbon. (Leibowitz-FIRL)

**DEWATERS SLUDGE.**
Water and Wastes Engineering, Vol 11, No 8, August, 1974. 1 fig.

Descriptors: *Sludge, *Dewatering, Water p tion control, *Centrifugation, Industrial wa Municipal wastes, Commercial wastes, *W water treatment, Alum, Activated sludge, E ment.
Identifiers: Sludg-a-Tron.

A centrifuge called the Sludg-a-Tron is being ized in pollution control and processing ser for dewatering and concentrating a wide ran industrial, municipal, institutional and comme sludge wastes. The centrifuge is able to con trate sludges from one percent, solids up to 35 cent solids by weight and higher, treating ae cally digested sludges, biological sludges, activated sludges, water treatment alum slu and other industrial wastes. The Sludg-a-Tr expected to be broadly utilized in waste treat facilities on two-stage dewatering systems. A solids capture rate, with efficiencies ranging 99 percent, is achievable without the us polyelectrolytes or flocculants. The centrifug achieve a uniformity of cake, and a high degr cake compaction, without regard to feed ra composition. Some advantages listed are imum installation space, low operating s minimum power requirements, design simpl choice of driving arrangements, and a large of options and accessories. (Leibowitz-FIRL)

**SLURRY DELIQUORING BY EXPRESSION,**
Nagoya Univ. (Japan). Dept. of Chemical Engineering.
M. Shirato, T. Murase, and T. Aragaki.
Dechema Monographien, Vol 74, No 1432/1451, p 9-39, 1974. 27 fig.

Descriptors: *Separation techniques, *Sewage treatment, *Waste water treatment, Sewage sludge, Equations, Filtration.
Identifiers: Solid-liquid systems, Compression, Slurry deliquoring, Expression.

The theoretical developments and subsequent experiments to verify equations concerning the expression process, defined as the separation of a liquid from a solid-liquid system by compression, are discussed. The expression method of deliquoring is widely used in both chemical process industries and in sewage sludge treatments. Its mechanisms consist of two steps of flow phenomena, which may be analysed first by filtration theory and second by consolidation theory. Expression operations are seen to be classified into three types: constant pressure; constant rate; and variable pressure-variable rate operations; according to the time-pressure and flow rate relations. Basic laws govern the flow of fluids through porous media, and conventional definitions of filtration and consolidation characteristics aid in developing basic consolidation equations, as well as new definitions of filtration ratio, consolidation ratio, and modified consolidation coefficient. Good agreement between theories and experiments by using compression-permeability cell data was demonstrated. (Prague-FIRL)

**CHLORINE-CONTAINING ORGANIC CONSTITUENTS IN CHLORINATED EFFLUENTS,**
Oak Ridge National Lab., Tenn.
R. L. Jolley.
Journal Water Pollution Control Federation, Vol 47, No 3, p 601-618, March, 1975. 3 fig, 7 tab, 29 ref.

Descriptors: *Waste water treatment, *Chlorine, Analytical techniques, Chromatography, Municipal wastes, Effluents, *Chlorination, Organic compounds, Sewage treatment.
Identifiers: Organic constituents.

An examination was made of the chlorine-containing compounds present in the chlorinated primary and secondary effluents from two domestic waste water treatment plants. A 36C1 tracer, high resolution chromatographic method was used in the examination. Conclusions reached as a result of the study as are follows: stable chlorine-containing organic constituents were present after effluents had been chlorinated to a 1 to 2 mg/liter chlorine residual; anion-exchange chromatographic elution positions were established for these constituents; the chlorination yield was about one percent for a typical chlorinated secondary effluent; the chlorination yield was approximately constant with respect to chlorine dosage, but increased with increasing reaction time; the chlorination yield was about equal for both primary and secondary effluents; the major portion of the available chlorine in the chlorination of effluent was consumed in oxidation reactions; and, essentially equivalent results were obtained regardless of whether the effluent was chlorinated with chlorine gas or with hypochlorite solution. **AERATION DEVICES: BASIC THEORY,**
Cape Town Univ. (South Africa). Dept. of Water Resources and Public Health Engineering.
G. v. R. Marais.
Water Pollution Control, Vol 74, No 2, p 172-173, 1975.

Descriptors: *Waste water treatment, *Aeration, Equipment, Air entrainment, Bubbles, Aerobic conditions, Oxygen, Mixing, Dissolved oxygen, Oxidation.
Identifiers: Diffused-air bubble aerators, *Mechanical aerators.

Aeration in waste water treatment is the process by which oxygen is supplied to the liquor so that the organisms present are able to oxidize the organic content of the waste water. The three stages of transfer of oxygen from the gaseous to liquid phase are: transfer of the oxygen molecules from the air to the liquid interface; passage of the oxygen through a liquid film of about three molecules thick by molecular diffusion; and, dispersion of the oxygen into the body of liquid by further diffusion and convection. The two basic types of aeration devices, diffused-air bubble aerators and mechanical aerators, both utilize the first stage of oxygen transfer. The diffused-air principle introduces small air bubbles through diffusers; oxygen transfer from the interface to the body of liquid is governed principally by the process of molecular diffusion and therefore is greatly affected by surface impurities in the liquid. In mechanical aeration, the shearing action of the impellers creates new interfaces; mass transfer is governed by surface renewal and only slightly affected by diffusion transportation. Manufacturers of aeration equipment usually give a figure for the oxygen transfer rate, the mass of oxygen that the aeration device can introduce into a body of water per unit of time-per unit of power absorbed at the aerator shaft. Equations are presented which enable one to modify the manufacturer's figure for oxygen transfer rate to allow the non-standard conditions during operation. (Orr-FIRL)

**ADJUDICATING TENDERS FOR AERATION DEVICES: BEST VALUE AND RELIABILITY,**
J. Halliday.
Water Pollution Control, Vol 74, No 2, p 184-185, 1975.

Descriptors: *Aeration, Equipment, *Waste water treatment, Costs, Economics.
Identifiers: *Aeration devices.

In deciding which aeration device to choose one must consider more than just the capital cost. One method for doing this is to calculate the annual interest and redemption on the capital and add this to a calculated cost of power required. For a conventional aeration plant the annual power cost may equal the annual interest and redemption on the aeration equipment, while for an extended aeration plant the cost of power may be twice that of interest and redemption. The efficiencies of all the components of an aeration device must be examined in relation to their particular mode of operation. Efficiencies of all the components of an aeration device tend to decrease with reduced load. This reduction in efficiency must be considered where water levels vary considerably or if there is to be oxygen control by means of two-speed motors or varying the depth of aerator immersion. In terms of reliability attention should be given to the drive for the aerator, the gearboxes, bearing life, to methods which prevent the total loss of oil from the gearbox in the event of the failure of the oil seal, and which prevent moisture from getting in the gearbox. Ensuring reliability in the plant begins in the specifications. Reliability costs money and is dependent upon good basic mechanical design. The purchaser should set his minimum standards in the specifications and then perhaps place weight on the additional features which may be offered by various aeration devices. (Orr-FIRL)

**SETTLEMENT AND SLUDGE RETURN IN ACTIVATED-SLUDGE TYPE PACKAGE PLANTS,**
P. B. B. Vosloo.
Water Pollution Control, Vol 74, No 2, p 197-198, 1975. 2 ref.

Descriptors: *Activated sludge, *Waste water treatment, Aeration, Sludge, Dissolved oxygen, *Sludge treatment, *Treatment facilities.
Identifiers: Packaged plants, Sludge return.

The sludge in most activated sludge package plants occasionally tends to be light and bulky. This is frequently due to over aeration. To control this, the oxygen input should be arranged so that at peak flow the DO drops to below one mg/liter, while at low flows it rises to 3 or 4 mg/liter. Because of the tendency of package plants to produce a light, flocculent sludge, it is recommended that their sedimentation sections provide for a lower rise rate than that which is normally acceptable for larger plants. It is better to by-pass a portion of the incoming flow when a period of abnormally high flow coincides with a period of abnormally light sludge, rather than to pass everything through the plant and risk losing a large proportion of the activated sludge. Many packaged plants do not have mechanical means for returning sludge but rely instead on the slight difference in density between sludge in the lower portions of the settling zone and the mixed liquor in the aeration zone to make the sludge flow back into the aeration zone by gravity. This type of system has been found unsatisfactory. The best type of package plant has a pump for the return of the sludge. Sludge return ratios in excess of 1:1 are unnecessary unless the sluge level in the settling zone rises to near the overflow level in which case the the ratio may be increased to 1.5:1 or even 2:1. **UNDERGROUND WASTEWATER TREATMENT PLANTS,**
Vattenbyggnadsbyran Ltd., Stockholm (Sweden). Water and Environmental Div.
E. Isgard.
Journal Water Pollution Control Federation, Vol 47, No 4, p 684-687, April, 1975. 1 fig, 1 tab, 4 ref.

Descriptors: *Waste water treatment, *Construction costs, Water reuse, Design criteria, Odor control, *Treatment facilities.
Identifiers: *Underground treatment plants, Ventilation, *Sweden.

The underground construction of water reclamation plants is an established technique in Sweden. Problems encountered in design and operation of underground plants are discussed. While underground facilities were originally designed for civil defense, the present advantages of undergrounding are saving of space in urban areas, ease in expansion of facilities, environmental control, and protection against adverse weather. Specific cost problems are related to construction in various types of rock. Design criteria must consider expandability; for example, at Kappala, a transport tunnel was built between the existing and future plants. Proper heating and ventilation are necessary, particularly ventilation of hydrogen sulfide from pre-aeration. Measures must be designed for odor control and to prevent inundation and explosions. Careful tightening of excavation is also required to prevent drainage of soil above the excavations and settling of streets or buildings. Such design difficulties have been overcome at many underground facilities in the Stockholm area, providing favorable treatment results. (Prague-FIRL)

**INNOVATIVE PROCESS TREATS WASTEWATER,**
D. A. O'Sullivan.
Chemical and Engineering News, Vol 53, No 18, p 27-28, May, 1975. 1 fig.

Descriptors: *Waste water treatment, *Sewage treatment, *Aeration, *Biological treatment, *Aerobic conditions, Equipment, Pilot plants, Treatment facilities.
Identifiers: Deep shaft process.

A deep shaft process for waste water treatment may be considered as the most significant advance in sewage technology in the past 60 years. The advantages of this technique over conventional water treatment methods include: low capital and operating costs; more economical use of land; absence of offensive odor; and, lower production of sludge. The process involves continuous circulation of waste water throughout a vertical shaft. Aerobic bacteria feed on the entrained organic matter. A stream of air injected into the shaft provides both the driving force to maintain circulation and the oxygen necessary for aerobic biological treatment. The unit is a cylindrical steel or concrete shaft, with a diameter between 0.4 and 10.0 m, which extends into the ground to a depth of 100-300 m. The dimensions depend on the volume of effluent to be treated. A unit 135 m deep is capable of efficiently accepting and transferring one kg of oxygen/hr/cu m of effluent. The process results in an overall land saving of about 50%. The large activated sludge ponds and anaerobic digestion units are eliminated. Oxygen uptake efficiency can be 90% or greater in the new system compared with the 10% level achieved in present-day sewage treatment works. A pilot unit has been running continuously treating whole raw sewage from the sewage works at Billingham, Great Britain. (Orr-FIRL)

**ANAEROBIC ACIDOGENESIS OF WASTEWATER SLUDGE,**
Institute of Gas Technology, Chicago, Ill.
S. Ghosh, J. R. Conrad, and D. L. Klass.
Journal Water Pollution Control Federation, Vol 47, No 1, p 30-45, January, 1975. 7 fig, 7 tab, 16 ref.

Descriptors: *Waste water treatment, *Methane, *Sewage treatment, Anaerobic conditions, *Anaerobic digestion, Anaerobic bacteria, Digestion, *Sludge treatment.
Identifiers: *Anaerobic acidogenesis.

The anaerobic digestion process is popular in the waste treatment field because of the following reasons: its capability of stabilizing large volumes of dilute organic slurries at low cost; its low biomass production; the high kill rate of pathogenic organisms; its capability of producing solid residue suitable for use as soil conditioners; and, its ability to convert the organic carbon in the feeds to a product gas stream high in methane that can be substituted for natural gas. This study was designed to determine the feasibility of maintaining dominant cultures of acidogenic organisms with waste water sludge feeds by kinetic control, compile information on the biokinetic characteristics of acidogenic organisms; and, to develop guidelines and criteria for operating acid-phase digestion with waste water sludge feeds. A general discussion on the theory and operating principles of the two-phase digestion process is presented with special emphasis on the acidogenic phase of the total process. Results of the study showed that stable, steady-state operation of the two-phase process is possible with waste water sludge for extended time period. The two-phase digestion process may be operated at one-half of the detention time of a high-rate digester and still exhibit higher rates of solids stabilization and methane production. The suggested reason for this high achievement is that phase operation allows the two groups of digester organisms to attain their full metabolic potential and thereby effect substantial improvement in overall digestion efficiency. **$3-MILLION AND TWO-AND-A-HALF YEARS TO SOLVE CAMPBELL RIVER'S SEWAGE PROBLEMS,**
G. Beardsley
Water and Pollution Control, Vol 113, No 4, p 57-59, April, 1975.

Descriptors: *Sewage treatment, *Waste wat treatment, Storm runoff, Sewerage, Pipeline Pumps, Interceptor sewers, Planning, *Canad *Treatment facilities.
Identifiers: *Campbell River(BC)

The Campbell River District, British Columbi has designed a secondary sewage treatment to the needs of its population of 11,000. The area h been subjected to intrusion of storm water into t sanitary system. A new collection system a treatment plant were planned and funded fro various federal and provincial sources. The enti project was carried out between February 19 and May 1974. A 14,000 foot long trunk pressu line was constructed so as to serve the area n tially by gravity. An eighteen-inch diameter Sch pipe was chosen for the pressure main. Fo pumping stations were installed along the highwa Flygt pumps were used throughout the syste The installation of collector sewers was co plicated by the problem of terrain, necessitati grading the trunks continuously because of t shoreline is very close and seepage from the s was a danger. The plant was designed a screened so as to be aesthetically compatible w its residential surroundings. Public relations e forts were also made and the reaction to the n system was favorable. The plant capacity is c rently enough to serve a population of 15,000, w anticipated modular additions for a population 30,000. (Prague-FIRL)

**ALGAE REMOVAL USING DISSOLVED A FLOTATION,**
Ellsworth Engineering and Associates, Ida Falls, Idaho.
W. F. R. Bare, N. B. Jones, and E. J. Middlebrooks.
Journal Water Pollution Control Federation, V 47, No 1, p 153-159, January, 1975. 18 fig, 3 tab, ref.

Descriptors: *Waste water treatment, Alg Suspended solids, *Flotation, Flocculation, Pi plants, Laboratory tests.
Identifiers: *Algal removal, *Dissolved air flo tion, Ferric sulfate, Alum.

The study described was conducted to evalu the effectiveness and economic of dissolved flotation as a method of removing algae fr waste water stabilization pond effluents. operating parameters studied included algae c centration, coagulant dosage, and percent recycle. Some of the conclusions made, based bench-scale and pilot plant tests, are as follo direct pressurization did not provide g suspended solids removal in raw, naturally floc lated, or chemically flocculated algal sampl pressurized recycle greatly improved the remo efficiencies in naturally and chemically floc lated samples; 85 mg/liter of ferric sulfate w required to flocculate an algal suspension of ab 100 mg/liter to obtain solids removal greater t 90% in the batch tests; 75 mg/liter of alum w required to flocculate an algal suspension of ab 100 mg/liter to obtain solids removal greater t 90% in batch tests; 175 mg/liter of alum w needed to flocculate an algal suspension of ab 125 mg/liter to obtain 90% solids removal in p plant tests; and, the difference in chem requirements between pilot plant and bench-s tests was thought to be caused by a higher conc tration of algae in pilot plant tests, a major ference in the algal species being removed, and dynamic nature of the pilot plant tests as c pared with the static, ideal conditions of ben scale tests. The total annual cost of operating flotation system was estimated to range fr $39,000/year for a one mgd plant to $457,300/y for a 20 mgd plant. (Orr-FIRL)

tions to the activated sludge process for val of nitrogen and phosphorus neces-anges in the design and application of equipment. The removal of phosphates age by precipitation without chemical ad-s been observed in plug-flow plants. In fine bubble aeration in the last compart-a minimum DO content of 3-4 mg/liter quor are recommended. When ferrous used to precipitate phosphates (200 errous sulfate), the oxygen requirements o 7.5 oxygen/liter of feed. The modifica-e activated sludge process for the total f nitrogen involves recycling of nitrate-d liquor to a compartment at the head of on basin. The first and third basins are d but stirred to keep the solids in suspen-DO in the second basin should be kept one and 2 mg/liter. Therefore, the aera-is basin should be of such a size and so located in the basin that they can be switched in or out according to the oxygen requirements. Whether to use surface aerators or bubble aerators depends upon several factors. Surface aerators are generally more economical than bubble aerators when only oxygen transfer efficiency is considered. The cooling effect of the various aerators needs to be considered when nitrification and denitrification are desired since reaction rates decline with decreasing temperatures. Automatic control of DO is recommended since this results in a power cost savings that can offset in two years the cost of the equipment for DO control. (Orr-FIRL)

**ICI'S DEEP SHAFT 'HALVES SLUDGE VOLUME',**
B. Appleton.
New Civil Engineer, April, 1975. 3 fig.

Descriptors: *Waste water treatment, *Sewage treatment, Biological treatment, Equipment, Industrial wastes, Sludge, Treatment facilities.
Identifiers: *Deep shaft process, Sludge production volume.

ICI's Agricultural Division has developed a new treatment process for raw sewage of industrial effluent. The effluent circulates around a 150 m deep shaft and emerges requiring only final settlement and sludge dewatering. The claims for the deep shaft process include: only 50% of the sludge volume generated by a conventional works; low capital cost; low operating cost; a highly efficient oxygen transfer system makes the process ideal for roughing treatment of high strength liquors; and, absence of odor. The process relies on a colony of bacteria in the circulating liquor to purify the effluent. The effluent circulates vertically in the shaft, completing about 20 circuits in the 2 hour retention time. The air used for biological oxidation also provides the driving force for liquid circulation. The process involves: feeding incoming sewage into a vertical carbon steel tube extending to the bottom of the shaft; recycled sludge from the subsequent sludge-separation stage is added to maintain the bacteria colony; air is injected into the inner tube to provide the necessary oxygen; spent air is vented to the atmosphere at the head of the shaft; and, a conventional overflow weir outlet carries the purified effluent to the sludge separation stage. Deep narrow shafts are preferred for weak liquors requiring high quality treatment, while roughing treatment of high strength industrial waste is most economically provided in shallower broader shafts. One hundred and fifty meters has been chosen as the optimum depth for domestic sewage treatment, the shaft diameter being fixed by the design retention time of 2 hours. (Orr-FIRL)

**NITROGEN REMOVAL IN A PILOT PLANT,**
Vattenbyggnadsbyran Ltd., Stockholm (Sweden).
B. Ericsson.
Journal Water Pollution Control Federation, Vol 47, No 4, p 727-740, April, 1975. 9 fig, 2 tab, 18 ref.

Descriptors: *Nitrification, *Denitrification, *Waste water treatment, Pilot plants, Filters, Tanks, Sludge, Costs, Nitrogen, Nutrient removal, Phosphorus.
Identifiers: Phosphorus removal, Sweden.

Nitrogen removal is used as an alternative to phosphorus removal in limiting algal growth. While the method chosen depends on the type of water and dissolved nitrogen compounds, concentrations, and associated costs, the most promising method in Sweden is biological nitrification-denitrification. Results from a pilot plant operation demonstrated that biological nitrification in a tank system is best accomplished by a double sludge system for combined and separate carbon degradation and nitrification. Critical rate of nitrification at 95% yield was found to be about 3.0 and 2.2 NH3-N/hr/g vss at 18 C and 12 C, respectively. The BOD:NH3-N ratio after pre-sedimentation influences the oxygen requirement, the sludge yield and the acid produced; pH is also very important. The rate of denitrification in the anaerobic filter with plastic media at about 95% yield during the first period at 18 C was about 9 g NO3(-)-N/hr, with a 1.8 hour detention time. The choice between a tank reactor and an anaerobic filter for denitrification depends upon costs and upon operational safety. While the anaerobic filter proved to be safer during the operational trial, it was more expensive. It was recommended that further experimentation be conducted to improve the sludge settleability in the tank reactor system and the system be compared with flotation. (Prague-FIRL)

**INDUSTRY AND COMMUNITY IN COOPERATION,**
K-Konsult, Lund (Sweden).
L. Nilsson.
Journal Water Pollution Control Federation, Vol 47, No 4, p 760-763, April, 1975. 4 fig.

Descriptors: *Waste water treatment, Municipal wastes, Biochemical oxygen demand, Biological treatment, Alum, Economics, *Treatment facilities, Industrial wastes.
Identifiers: Sweden, *Combined treatment.

A successful combined municipal/industrial waste water treatment facility is described. The plant was designed for the township of Kagerod, Sweden and a milk products industry. The township's population, under 2000, produces about 270 lb of biochemical oxygen demand per day. Industrial waste water is expected to average 1000 lb BOD per day, corresponding to 7500 person equivalents. Average daily flow for the new treatment plant will accomodate 4950 cu ft/hr, 1030 cu ft/hr of this from the milkfood plant. The facility uses biological treatment with the activated sludge method and chemical post precipitation treatment with alum. Sludge is dried with industrial smoke and a Nateko dryer. Operation results since 1972 have been very efficient; water emitted from the plant showed a remainder of 22 mg BOD/gal, 27 mg nitrogen/gal, and 0.9 mg phosphorus/gal, or a reduction of 99, 89, and 99%, respectively. The dryer is successful in sulfur reduction as well. The dryer makes it possible to use heating oils with a high sulfur content and still emit less sulfur, thus decreasing costs of heating oil The results of this system are a economical advantage for both industry and the municipality and a cleaner living environment. **WASTEWATER TREATMENT PLANT ODORS: A CONTINUING ENIGMA,**
Pittsburgh Univ., Pa. Dept. of Civil Engineering.
R. D. Neufeld.
Public Works, Vol 106, No 3, p 83-84, 106, 107, March, 1975. 1 tab, 22 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Odors, *Municipal wastes, Treatment facilities, Absorption, Adsorption, Organic compounds, Pollution abatement, Pennsylvania.
Identifiers: Allegheny County(Penn).

One major problem in the operation of both domestic and industrial waste water treatment plants is the control of odors. The Allegheny County Sanitary Authority (ALCOSAN) has built a treatment network for coping with this problem. Because of the complexity of odorants from various sources, six general classifications of techniques for abatement of odorous air have been defined. These are: combustion; adsorption; absorption; vapor mixing; source reduction; and dilution. Source reduction is a difficult defense against odors, and dilution of odors by discharge through tall stacks into the atmosphere is an alternative which has been discouraged. Combustion for complete destruction of organics requires high temperatures for a sufficient time period. Adsorption with activated carbon requires a system design which accounts for the variety of potential odorants, and determines the offending chemical which is most poorly retained on the carbon. Absorption or scrubbing is suitable only when odorous vapors are soluble, reactive, or emulsifiable in water. Also, organic compounds which comprise most of the odor producing substances in waste are insoluble without the addition of oxidants. Vapor mixing with odor masking or odor modification is controversial as it is not always successful and it does not reduce the atmospheric burden of organic gases but rather increases it. ALCOSAN is presently most concerned with fecal odor from sewage sludge process; gases from filters will be ducted into existing incinerators, other control will require chemical oxidation. **CARBON REGENERATION BY WET AIR OXIDATION,**
Zimpro, Inc., Rothschild, Wis.
W. B. Gitchel, J. A. Meidl, and W. Burant, Jr.
Chemical Engineering Progress, Vol 71, No 5, p 90-91, May, 1975. 1 fig, 1 tab, 12 ref.

Descriptors: *Waste water treatment, *Activated carbon, Adsorption, Tertiary treatment, Laboratory tests, Sewage treatment, Physical properties, Water quality, *Oxidation.
Identifiers: *Wet air oxidation, Carbon regeneration.

The results of physical and chemical tests and full-scale plant tests on the water quality produced by wet air oxidation regenerated activated carbon are summarized. The quality of the water produced by the regenerated carbon was found to be equal to that obtained by using virgin carbon. Results indicate that wet air oxidation causes some reduction in surface in pores under 10 angstroms radius with no change in surface in all other pores. Absorption isotherms show that most Cl-C4 compounds are readily adsorbed even by virgin carbon with a full complement of surface in the smallest pores. These small carbon compounds are readily removed by biological treatment, suggesting therefore that the surface in 10 angstrom or smaller pores is not essential in waste water treatment. The chemical and physical tests show that wet air oxidation does restore all the adsorbate relative efficiencies (R.E.) and pore structure of the parent carbon to a very high degree with the exception of the mentioned small pores. It is concluded that spent carbons may be fully regenerated by wet air oxidation in terms of the application of these carbons. (Orr-FIRL)

**LAMELLA SEDIMENTATION: A COMPACT SEPARATION TECHNIQUE,**
Svenska Traforskningsinstitutet for Industriforskning, Stockholm (Sweden). Engineering Dept.
B. Forsell, and B. Hedstroem.
Journal Water Pollution Control Federation, Vol 47, No 4, p 834-842, April, 1975. 12 fig, 3 ref.

Descriptors: *Waste water treatment, Sedimentation, *Settling basins, *Separation techniques, Equipment, Sludge treatment.
Identifiers: *Lamella separators, *Lamella sedimentation.

Lamella sedimentation has the advantages of reducing the demand for large building areas and/or volumes and also of low operating and overall costs. Modern lamella sedimentation techniques have profited from advances in fluid dynamics research and materials technology. A general description of lamella sedimentation is given with reference to the topics of surface effectiveness and compactness, sludge density, sludge volume and resistance to shear forces, flow variations, fluid mechanics, special problems of lamella sedimentation, and the mechanical construction and layout of a lamella sedimentation plant. The area that is theoretically available for separation in a lamella apparatus is equal to the sum of the projections on the horizontal plane of the separation plates. In a continuously working separator, a large enough inclination angle must be chosen so that the sludge separating on the plates may be continuously and efficiently removed. Flow pattern can be either cocurrent or counter current; the choice depends on the fraction of the sludge volume which is light, network forming, low yield stress and which is heavy, finely dispersed, high yield stress. A lamella sedimentation plant consists of a particular number of separating plates working in parallel, large plants may contain several thousand. Smaller plants, less than 250 sq m, may be designed as package plants. In larger plants, the lamella device is usually one step in a process line in which all units are contained in a common concrete building block. (Orr-FIRL)

**VIRUS REMOVAL AND INACTIVATION DURING WATER TREATMENT,**
Maine Univ., Orono. Dept. of Civil Engineering.
O. J. Sproul.
Journal of the New England Water Works Association, Vol 89, No 1, p 6-15, March 1975. 5 tab, 12 ref.

Descriptors: *Waste water treatment, *Treatment facilities, *Viruses, Coagulation, Sedimentation, Filtration, Disinfection, Chlorine, Ozone, Recreation, Environmental effects.
Identifiers: *Viral removal, Virus inactivation.

The increased use of water for recreational purposes has made it necessary to decrease the viruses in water after treatment. Coagulation and sedimentation, rapid sand filtration and disinfection in a series are used by a complete water treatment plant. Removal of poliovirus can be as high as 99.9% when magnesium is precipitated from the water. Coagulation has also resulted in a high virus removal rate. Filtration through sand can remove viruses completely from treated waste water effluent provided the distance is long enough. Chlorine used properly is an effective viricide. Ozone is also an effective disinfectant. In the future research and development to minimize effects on the environment from viruses through treatment plants would be useful. Standards for treating potable and waste water should also be developed. (Dean-FIRL)

**ACTIVATED CARBON IN THE WATE TREATMENT PLANT,**
Massachusetts Dept. of Public Health, Lawrenc Lawrence Experiment Station.
A. E. Sylvia.
Journal of the New England Water Works A sociation, Vol 98, No 1, p 29-35, March 1975.

Descriptors: *Activated carbon, *Treatment fac ties, *Waste water treatment, *Water quality st dards, Public health, Legislation, Industr wastes, Surface runoff, Odor, Taste, Potat water, Microorganisms, *Pollutant identificatio Identifiers: Carbon chloroform extract, Rap Fluorescence Technique.

Coal is the source of granular activated carb commonly used by water treatment plants. Pub health officials are concerned not only by the od and taste problems but also by the chemicals fr industrial plant effluents and natural surface r noff entering the public water supply. Activat carbon beds and columns will adsorb the che cals most concerning the public health officials potential health hazards. The Environmental P tection Agency has been trying to pass a bill t would extend their authority beyond bacteriolo cal quality of water supplies to include physic chemical, and biological standards. Passage of t legislation would mean that a number of water d tricts would have to use additional treatment meet the standards. Carbon Chloroform Extr (C.C.E.) is high on the EPA list. Work is being c tinued on the development of a rapid fluorescen technique. The method has undergone extens testing and seems to be valid for measurement microorganisms in potable water when compa to the CCE method. (Dean-FIRL)

**HIGH COSTS MODIFY SEWAGE PLANT E PANSION.**
Engineering News-Record, Vol 194, No 15, p 82, April 10, 1975. 3 fig.

Descriptors: *Waste water treatm *Construction costs, *Treatment facilities, F rates, Costs, Potomac River, Biochemical oxy demand, Nitrogen, Phosphorus compou Estuaries, Cyanophyta, Fishkill, Sludge dispo Tertiary treatment.
Identifiers: Washington, DC, Blue Plains Sew Treatment Plant(DC).

Rising construction and energy costs have forc slowdown in the plans to expand and upgrade installing an advanced waste treatment system would remove nitrogen and phosphorus Washington, D.C.'s Blue Plains sewage treatm plant. The present facility is a modified activa sludge plant handling an average flow of 250 with a peak of 300 mgd with a secondary treatm process removing 70% BOD and suspended so The upgraded plant would handle 309 mgd wi peak of 650 mgd and the new modified aera plant will remove 95.5% BOD, 98% phosph and nitrogen and 90% ammonia. Because of Plains' proximity to the Potomac tidal estuary removal of both nitrogen and phosphate was lieved necessary to end growth of blue-green a which has on occasion matted and caused fishk If phosphorus removal could slow the gro construction costs would be lower. Sl disposal presents another problem. Incineratio the sludge according to present plans w require 50 million kwh of electricity and 13.7 lion gallons of fuel oil in 1978. Presently the sl is being disposed of by burying and surface disposal. Another solution is selling compo sludge for fertilizer providing the odor pro can be overcome. (Dean-FIRL)

**HOW TO ESTIMATE AND ESCALATE COSTS OF WASTEWATER EQUIPMENT,**
ICARUS Corp., Silver Spring, Md.
H. G. Blecker, H. S. Epstein, and T. M. Nichols.
Chemical Engineering, Vol 81, No 22, p 115-121, October, 1974. 13 fig, 2 tab.

Descriptors: *Waste water treatment, *Costs, *Equipment, Computer programs, Engineering, Design, Installation, Water works, Alternative costs, Capital costs, Construction costs, Installation costs, Initial costs, Real costs, *Treatment facilities.

Charts and tables of cost data are presented to aid in the preparation of conceptual or rough estimates of the cost of facilities for treating waste water, or comparing alternative processing schemes. A technique for escalating the estimate to a future time is also described. The cost data were generated as a computer-aided design and estimating system which determines equipment costs in the same way as an equipment vendor and assembles the complete installed costs the same way a contractor does at the definitive stage. Graphs are included giving the purchased-equipment costs (or field-erected cost), equipment-setting manhours, installed-equipment cost, total field-labor manhours, and the labor-to-material ratio. An example of how to determine the escalation of cost is given. To determine the total installed cost for the equipment item in a South Philadelphia treatment plant in the 2nd quarter 1976, the estimated purchased-equipment cost for the 2nd quarter 1975, the material cost (less equipment) for 2nd quarter 1975 and the field-labor cost for 2nd quarter 1976 must all be calculated. The graphs cover such equipment as storage vessels, vertical pressure vessels, field labor for vertical pressure vessels, general-service centrifugal pumps, reinforced concrete aeration basins, motor-driven reciprocating pumps, motor-driven rotary blowers, variable speed motors and rectangular excavations. **YWA PLAN FOR CLEANER RIVERS,**
B. Appleton.
New Civil Engineer, p 21-22, January 23, 1975.

Descriptors: *Water pollution control, Rivers, *Waste water treatment, Water pollution sources, *Storm runoff, *Sewage treatment, Sewerage, *Overflow, Planning, Industrial wastes.
Identifiers: Yorkshire River Authority(Gt Brit).

The Yorkshire Water Authority, Great Britain, has developed plans for water pollution control of its two major rivers. Sources of pollution are both industrial and municipal. One problem is overflow from sewers during storms. Where the capacity of a sewer has been reduced to below twice dry weather flow, serious surcharging occurs during storms, causing pressure buildup so that manhole covers are blown off and sewage flows out of these openings. Infiltration from surrounding groundwater adds to normal surface runoff and thus further reduces the amount of foul sewage retained in the sewer. When the Rother river level rises, discharges from sewage overflows is shut off and sewage flows into the river as the storm abates and river flow drops. Plans include building of new interceptor sewers to pick up sewage from existing and new branch sewers and to carry up to 50 cu m/sec to a low level pumping station. Another development is a trunk sewer to relieve parts of the city. Besides sewerage problems, the area rivers are polluted from mine drainage. Treatment requires aeration for complete oxidation followed by settlement of the ochre. Other plans include an investigation of the possibility of mixing industrial effluents with domestic sewage for treatment at the local sewage plant. (Prague-FIRL)

**NITROGEN REMOVAL IN THE OPERATION OF THE MILILANI SEWAGE TREATMENT PLANT,**
Hawaii Univ., Honolulu. Water Resources Research Center.
G. L. Dugan, R. H. F. Young, and R. T. Tsutsui.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-244 718, $3.75 in paper copy, $2.25 in microfiche. Technical Memorandum No 44, September 1974. 20 p, 5 fig, 6 tab, 7 ref. OWRT A-047-HI(1). 14-31-0001-4011.

Descriptors: Nitrogen, *Activated sludge, *Anaerobic digestion, *Sewage treatment, Effluents, Eutrophication, Sludge treatment, Sedimentation, *Waste water treatment, Nutrient removal, *Hawaii, Settling basins, Aeration.
Identifiers: *Rapid Bloc process, *Nitrogen removal rates.

The effluent of the Mililani Sewage Treatment Plant (STP), Oahu, Hawaii, from January 1972 to January 1973 contained only approximately 30% of the total nitrogen that was originally in its raw sewage. During the period that high nitrogen removal rates were observed, raw sewage flowed directly to the 'Rapid Bloc' activated sludge unit. Sludge stabilization was by aerobic digestion. During the fall of 1973, a primary sedimentation tank and an anaerobic digester (which replaced the aerobic digester) were added to the components of the STP. A study was initiated for a one-year period, 1 July 1973 to 30 June 1974, in an attempt to determine the mechanism for nitrogen removal for both before (Phase I) and after (Phase II) modifications to the STP. The waste water flow during Phase I, July to August 1973, averaged 0.65 mgd with an overall total nitrogen removal of about 54%. The major nitrogen loss in the effluent speculated to be by means of gaseous ammonia to the atmosphere, apparently occurred in the aeration unit, settling tank, and aerobic digester. During Phase II studies, January through June 1974, the mean monthly flow increased by approximately 30% and the mean total nitrogen loss decreased to 29%, a range that is typical for conventional secondary activated sludge operations. In both Phases I and II, ammonia nitrogen was the predominant form showing major losses.

**PROCESS FOR TREATING SEWAGE SLUDGE,**
American Cyanamid Co., Stamford, Conn. (assignee)
H. P. Panzer, and K. W. Dixon.
U.S. Patent No 3,894,948, 7 p, 2 fig, 8 ref; Official Gazette of the United States Patent Office, Vol 936, No 3, p 1008, July 15, 1975.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, Water pollution treatment, Sludge treatment, Dewatering, Chemical reactions, Polymers, Waste disposal.
Identifiers: *Chemical treatment.

In the disposal of sludge formed in processing of sewage, it is beneficial to concentrate or thicken the sludges as much as possible to facilitate disposal. A method of treatment is provided which comprises adding to the sludge an effective

amount of a water-dispersible polyquaternary polymer consisting essentially of the reaction product of a lower dialkylamine, a polyfunctional amine, and a difunctional epoxy compound selected from the group consisting of epihalohydrins, diepoxides, precursors of epihalohydrins and diepoxides which under alkaline conditions are readily converted into the corresponding epoxy compounds and mixtures thereof. (Sinha-OEIS)
W75-11064

**PROCESS FOR TREATING INDUSTRIAL WASTES,**
American Cyanamid Co., Stamford, Conn. (assignee)
H. P. Panzer, and K. W. Dixon.
U.S. Patent No 3,894,946, 8 p, 8 ref; Official Gazette of the United States Patent Office, Vol 936, No 3, p 1007-1008, July 15, 1975.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, Water pollution treatment, Water quality control, *Flocculation, Chemical reactions, *Polymers.
Identifiers: *Chemical treatment.

A process of flocculating industrial wastes is described in which the wastes are treated with an effective amount of a polyquaternary polymer obtained from reaction of a major portion of secondary amine, a minor portion of polyfunctional amine and an epoxy type reactant whereby the polyquaternary polymer obtained has a solution viscosity at 25 C of at least 100 centistokes as a 37%, by weight, aqueous solution, based on the cationic portion of the polyquaternary compounds. **PROCESS FOR TREATING INDUSTRIAL WASTES,**
American Cyanamid Co., Stamford, Conn. (assignee)
H. P. Panzer, and K. W. Dixon.
U.S. Patent No 3,894,947, 5 p, 1 tab, 8 ref; Official Gazette of the United States Patent Office, Vol 936, No 3, p 1008, July 15, 1975.

Descriptors: *Patents, *Waste water treatment, *Industrial wastes, Water pollution treatment, Water quality control, *Flocculation, Chemical reactions, Polymers.
Identifiers: *Chemical treatment.

Flocculatable industrial wastes are treated with effective amounts of polyquaternary polymers obtained by reaction of a difunctional epoxy type reactant with a secondary amine to a solution viscosity above a minimum value. This process has a widely diversified range of utility. The high efficiency of the process not only enables greater solids removal to be effected but allows desirable removal to be achieved at lower flocculant usages than is conventionally required. **AEROBIC LAGOON WASTE TREATMENT SYSTEM AND METHOD,**
Kimberly-Clark Corp., Neenah, Wis. (assignee)
A. R. Le Compte, Jr., and D. W. Appel.
U.S. Patent No 3,893,924, 5 p, 5 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 936, No 2, p 660, July 8, 1975.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, Water quality control, Water pollution treatment, *Aerobic treatment, Aeration, Water circulation, Lagoons, *Sewage lagoons, Aerated lagoons, Jets.

A highly efficient system and method for effectively treating liquids containing waste materials are disclosed. By the selection and placement of specific types of aerators it is possible to operate an aerobic lagoon at a fraction of the power requirements heretofore thought necessary. The system includes the use of jets placed within the liquid and directed so as to form primary circulation cells having an average velocity of at least about 0.3 foot per second and secondary circulation within the cells sufficient to substantially prevent solids which have been subjected to primary separation from settling out. The flow within the cell is designed to be complementary to adjacent cells and create a serpentine path from inflow to outflow of the lagoon. A quiescent zone may be provided within the lagoon for sludge settling, or a separate polishing pond may be utilized. (Sinha-OEIS)
W75-11069

**MOBILE UNIT FOR TREATING LIQUID WASTE,**
Chemfix, Inc., Pittsburgh, Pa. (assignee)
D. J. Opacic, A. L. Lengyel, E. A. Zawadzki, and F. H. Jackson.
U.S. Patent No. 3,893,656, 4 p, 13 fig, 12 ref; Official Gazette of the United States Patent Office, Vol 936, No 2, p 576, July 8, 1975.

Descriptors: *Patents, *Waste water treatment, Industrial waste, *Waste disposal, Water pollution control, Water quality control, Equipment, Liquid wastes.
Identifiers: Setting agents, Mobile equipment.

A mobile unit for treating liquid waste to render it non-polluting and fit for ultimate disposal includes a mixing hopper having an inlet for receiving liquid waste, and an outlet for connection to a conduit extending to the disposal area. The unit also includes a bin for a powdered setting agent for a liquid alkali metal silicate. The bin has an outlet at its bottom and a porous floor spaced above its bottom. Compressed air is delivered to the space beneath the floor to form a fluidized bed of setting agent above the floor. The setting agent is delivered to the mixing hopper in which it is mixed with the liquid waste. After the mixture leaves the hopper, liquid alkali metal silicate from a tank in the mobile unit is delivered to the mixture. The treated waste will set after it has reached the disposal area. (Sinha-OEIS)

**WASTEWATER TREATMENT PLANT,**
Autotrol Corp., Milwaukee, Wis. (assignee)
W. N. Torpey.
U.S. Patent No. 3,894,953, 5 p, 5 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 936, No 3, p 1010-1011, July 15, 1975.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Organic wastes, Water pollution control, *Septic tanks, Separation techniques, Anaerobic digestion, Biological treatment, Hydrogen sulfide, *Treatment facilities.

A modified septic tank with troughs arranged to be fed in parallel controls the detention time of wastewater passing through the troughs to the range of from 2 to 4 hours thereby minimizing the addition of gasses to the effluent wastewater, particularly hydrogen sulphide that is evolved in the lower portion of the tank in connection with the digestion of settled organic solids. The substantial reduction of hydrogen sulphide in the effluent wastewater from the septic tank makes available a maximum amount of surface for the growth and maintenance of organisms oxidizing carbonaceous and nitrogenous pollutants on the downstream rotating contactors. A biological treatment unit such as those employing rotating contactors can be provided to treat the effluent from the septic tank. (Sinha-OEIS)
W75-11076

**FLOCCULATION DEVICE FOR WASTE FLUID TREATMENT,**
Wheelabrator-Frye Inc., New York. (assignee)
C. K. Walther, K. Beckschafer, and K. E. Temme.
U.S. Patent No. 3,893,921, 3 p, 2 fig, 3 ref; Official Gazette of the United States Patent Office, Vol 936, No 2, p 659, July 8, 1975.

Descriptors: *Patents, *Waste water treatment, *Water purification, Water pollution treatment, *Coagulation, *Flocculation, Equipment.
Identifiers: Vibration.

An apparatus for coagulating and flocculating waste fluid includes a tank attached to a vibrating treatment device from which the waste fluid is discharged. A variable rate pump or other means injects a flocculating agent into the tank, where it is effectively mixed with the waste fluid due to the vibration of the treatment device. The waste fluid containing the flocculated material in suspension is then discharged from the tank for subsequent separation, as by filtration, centrifuge or the like. The apparatus employs a siphon-like arrangement to obtain greater efficiency under a continuous flow mode of operation. (Sinha-OEIS)
W75-11077

**TOTAL WASTE RECYCLE SYSTEM FOR WATER PURIFICATION PLANT USING ALUM AS PRIMARY COAGULANT,**
Rensselaer Polytechnic Inst., Troy, N.Y. Dept. of Chemical Engineering; and Rensselaer Polytechnic Inst., Troy, N.Y. Dept. of Environmental Engineering.
L. K. Wang, and J. Y. Yang.
Resource Recovery and Conservation, Vol 1, No 1, p 67-84, May 1975; 4 fig, 10 tab, 34 ref. WA88-188, WA86-361.

Descriptors: *Waste water treatment, *Water treatment, Water quality, *Sludge treatment, *Recycling, *Coagulation.
Identifiers: Acid treatment, Alkaline treatment, Alum sludge, Zero waste discharge, Resource recovery, *Waste recycling, Filter backwash water, Alum recycle.

A systems study to investigate the feasibility of total recycle of wastes generated from water purification plants has been conducted. Wastewater and alum sludge used in were collected from a water plant employing water treatment process including aeration, chemical addition, mixing, flocculation and sedimentation followed by filtration, pH adjustment, fluoridation and chlorination. Wastewater and sludge are generated mainly from the sedimentation basin and the filter backwash. The waste recycle system studied consisted of (a) treating the filter backwash water in a sludge separator, (b) dividing the combined sludge into two fractions for alum solubilization respectively in an acid treatment unit and an alkaline treatment unit, (c) screening the inert silt for ultimate disposal, and (d) returning the solubilize alum from the acid and alkaline treatment units in proper proportions for reuse as flocculation agent. The proposed recycle process was designed to provide a cost effective system for achieving 'zero' waste discharge from a water purification plant. Inasmuch as the inert silt collected during water treatment is derived from raw water supply, an elimination of added chemical discharges to

egarded as satisfying the desired 'zero' arge objectives. Although detailed process n parameters necessary to achieve the above l goal have not been established, experimen- sults tend to suggest that practical designs on the proposed recycle system are feasible. 11094

EFFECTS OF FREE AMMONIA AND NITROUS ACID ON THE NITRIFICA- PROCESS,
ll Univ., Ithaca, N.Y.
Anthonisen.
ble from University Microfilms, Inc., Ann Mich, 48106. Order No 74-24,253. PhD , 1974, 323 p.

ptors: *Ammonia, *Nitrification, Municipal , *Waste water treatment, Nitrites, s, Pilot plants, Microorganisms, Bacteria, Denitrification, Inhibition.
iers: Un-iodized ammonia, Un-iodized Nitrobacter, Nitrosomonas, *Nitrous acid.

ch has been conducted on the accumula- f nitrite as observed in soil, natural waters ste treatment systems which receive indus- gricultural, and municipal wastes. The esis postulated was that un-ionized am- FA) and unionized nitrite (FNA) are inhibi- nitrifying organisms and their effects cause to accumulate and persist. Both laboratory t plant tests were completed to investigate tion rates for the organisms Nitrosomonas robacter. Results indicated that FA inhibi- Nitrobacter occurred at concentrations ower than those required to inhibit nonas. Nitrites thus accumulated without ent oxidation to nitrate. In liquid waste accumulation of nitrite was shown to be related to concentrations of FA and FNA pendent of pH, ammonia and nitrite con- ns. FA inhibits Nitrosomonas nitrifica- 10.0 to 150.0 mg/liter; FA inhibits ter at 0.1 to 1.0 mg/liter; and FNA inhibits nonas and Nitrobacter nitrification at 0.22 /liter concentration. It appears possible to ne nitrification patterns that occur during lation of ammonia using operational es that consider the inhibitory effects of NA. (Prague-FIRL)

ES OF BIODEGRADABILITY AND TORY ORGANICS IN WASTE- : (ANALYSIS, INTERPRETATION, PPLICATION OF MEASUREMENT QUES),
ut Univ., Storrs.

from University Microfilms, Inc., Ann ich, 48106. Order No 75-10,627. PhD 75, 125 p.

s: *Measurement, *Oxidation, , Carbon, Nitrification, dation, *Analytical techniques, Mu- stes, Industrial wastes, *Waste water *Pollutant identification, *Refractivity. Refractory Index(RI), Ultimate Ox- nd(UOD).

te Oxygen Demand (UOD) method for the total amount of oxidizable material drogen, oxygen, carbon, and nitrogen, was developed. A working parameter ated to approach the derived evaluation tput responses of available analyzers. l Warburg Respirometer is used to he biodegradable portions of the total resent, with a correction term for inconsistencies. The ratio of degrada- to the total oxidizable material is the Index (RI). The formula is RI = te)/UOD. According to this index, dable materials such as domestic raw sewage or glucose have RI values of 0.97 and 0.93, indicating 93-97% degradation, while industrial dye wastes or benzene have RI values of 0.56 and 0.23. Specific organic compounds were classified in terms of bio-persistence, using the RI values. Other uses of these values are suggested, such as the evaluation of acceptability of industrial waste discharge to municipal biological treatment facilities or the use as a preliminary treatment parameter. (Prague-FIRL)

WATER TREATMENT BY OZONE, (IN JAPANESE),
K. Oda.
Seikatsu Eisei, (J. of Urban Living and Health Assoc), Vol 18, No 6, p 168, 1974. 13 fig, 20 ref.

Descriptors: *Waste water treatment, *Reviews, *Water treatment, *Ozone, Oxidation, Detergents, Organic compounds, Color, Odors.
Identifiers: Reaction time, Decolorization, Deodorization.

The use of ozone for water treatment is reviewed. The greatest advantage of ozone usage is that it does not give any reaction residue. Ozone is one of the strogest oxidizing agents, therefore it decomposes most compounds in a relatively short reaction time. Ozone can be used for decolorization, deodorization, sterilization, and decomposition of organic compounds as well as of inorganic compounds such as cyanides. The sterilization effect of ozone is 15 to 30 times stronger than that of chloride gas or hypochlorous acid. Most decomposition of unsaturated organic compounds by ozone is believed to proceed by ozonolysis followed by aldehyde formation and stable organic acid formation. Ozone is also useful in treating synthetic detergents such as alkyl benzene sulfonate for which biological treatment is very difficult. If ozone alone is used to treat water, a large amount of ozone consumption is needed and the process is less economical. Therefore, ozone treatment is recommended for use with other water treatment methods such as activated carbon and floatation techniques. (Katayama-FIRL)
W75-11107

ACTIVATED CARBON ADSORPTION TECHNIQUE FOR THIRD STAGE SEWAGE WATER TREATMENT, (IN JAPANESE),
T. Kasakura.
Kankyo Sozo, (Environment Creation), Vol 5, No 1, p 72, January, 1975. 10 fig, 3 tab, 7 ref.

Descriptors: *Waste water treatment, *Activated carbon, *Sewage treatment, Tertiary treatment, Pilot plants, Filtration, Precipitation(Chemical), Adsorption, Turbidity, Phosphorous.
Identifiers: Aluminum sulfate, Adsorption towers.

A pilot plant to test the activated carbon adsorption technique for the third stage treatment of sewage water was constructed and operates at Nagoya city. The third stage water treatment plant consists of precipitation, filtration, and adsorption processes. After second stage treatment by an activated sludge method, sewage water is mixed with aluminum sulfate to precipitate most of the phosphorous compounds. The precipitates are filtered out at the rate of 350 m/d before entering an adsorption tower filled with 320 kg of activated carbon, with average particle sized of 0.90 mm. An average 72% of the total phosphorous in the second stage water was removed by the precipitation treatment, and 99% was further removed by the activated carbon treatment. The turbidity of the second stage water was improved an average 79% and 97% by aluminum sulfate precipitation and activated carbon treatments, respectively. The COD values in the precipitation and adsorption processes were 19.5 ppm and 1.8 ppm, respectively, and the corresponding TOD values were 38.9 ppm and 18.8 ppm. Several adsorption towers were installed in parallel and sewage water flowed through at the rate of 300 m/d. The life of activated carbon was between 800 to 1200 hr dependent on temperature which affected the efficiency of activated sludge treatment. The regeneration of deactivated carbon was seen to be achieved by heating at 800 C for 90 min. (Katayama-FIRL)
W75-11108

ON-SITE HYPOCHLORITE GENERATION,
Salford Univ. (England).
A. Kuhn.
Processing, Vol 21, No 3, p 6-7, 1975. 4 fig.

Descriptors: *Waste water treatment, *Sodium compounds, *Sewage treatment, *Municipal wastes, Electrolysis, Chemical industry, Industrial wastes, Equipment, Oxidation, Odors, Chemical oxygen demand.
Identifiers: On-site generation, Sodium hypochlorite, Great Britain, *Hypochlorite cells.

It has been shown that on-site generated sodium hypochlorite has several uses. The application for which this process has the greatest potential is in the treatment of municipal sewage. A sucessful demonstration of the process at Guernsey, Great Britain, involved pure seawater electrolysis followed by its passage to a separate stirred reactor tank where it was contacted with sewage. In the United States, Several installations using on-site hypochlorite generation are in operation. In Clark County, Nevada, only the supernatant liquid from the primary digester, rather than a full effluent stream, was electrolytically treated. Liquor was passed through the acutal electrolysis cell using electrodes of Pb02; benefits were attributed to direct oxidation of dissolved or suspended matter at the electrode surface. Vigorous evolution of gases achieved flotational effect. The froth that formed carried with it a high proportion of solids, leaving the liquor lower in COD. Modern commercially available hypochlorite cells are described; all were of the florce-flow, narrow gap design. The treatment processes detailed are also useful in oxidizing and disinfecting within the chemical industry, in heat exchanger fouling control, in deodorizing for tobacco plants, and in sterilizing of food processing equipment. (Prague-FIRL)
W75-11109

OPTIMUM VALUES FOR OPERATIONAL VARIABLES IN TURBIDITY REMOVAL,
Mosul Univ. (Iraq).
M. A. Al-Layla, and E. J. Middlebrooks.
Water and Sewage Works, Vol 121, No 8, p 66-69, August, 1974. 9 fig, 3 tab, 8 ref.

Descriptors: *Flocculation, *Water treatment, *Turbidity, *Alum, *Mathematical models, Operations, Treatment facilities, *Waste water treatment.
Identifiers: Alum dosage, *Turbidity removal.

A study was designed to define the effect of the main variables that can influence the efficiency of present flocculation basins in water treatment plants, thereby contributing to improving the design of flocculation basins. Variables were paddle speed, time, and alum dosage. The other objectives were to determine the interactions between time of flocculation and alum dosage, flocculation time and paddle speed, and paddle speed and alum dosage, flocculation time, and paddle speed. Methods included analysis of variance, linear, logarithmic, and multivariable mathematical models. It was concluded that the most significant idenpendent variable was paddle speed followed by flocculation time and alum dosage; dosage was 25 mg/liter for the study conditions; optimum paddle speed ranged between 40 and 50 rpm; and optimum flocculation time was about 30 minutes. Certain equipment and methods were shown to be important in removal of turbidity from water treatment plants. These were variable speed flocculator paddles, multiple flocculation basins that can be used in series or parallel operation, and the use of

jar tests to determine the optimum alum dosage continuously during the operation of water treatment plants. (Prague-FIRL)

**A PLANNING OF CATCHMENT SEWERAGE FOR OYODO RIVER (IN JAPANESE),**
M. Ishiguro, and Y. Watanabe.
Miyazaki Daigaku Kogakuru Kenkyu Hokoku, (Research Report of Miyazaki Univ., Dept. of Engineering), No. 20, p 35-45, August 1974. 5 fig, 12 tab, 20 ref.

Descriptors: *Sewerage, *Planning, *Waste water treatment, *Water quality control, Construction costs, Rivers, Water pollution, Treatment facilities, Biochemical oxygen demand, Waste treatment, Activated sludge.
Identifiers: *Oyodo River(Japan), Catchments.

A plan of catchment sewerage for protecting water quality of the Oyodo River in Japan is discussed. Present and future water quality were analyzed according to observed data. The river catchment area was divided into three blocks and the water pollution loads in each block were estimated. Within each area, construction-maintenance costs and treatment efficiencies of various sewer transport-treatment systems were compared. It was concluded that construction of high degree treatment plants with an activated sludge process for 95% BOD removal should be implemented in all three blocks. However, a treatment plant of 95% BOD removal is very difficult using present techniques. Thus, it was advised to use other treatment processes simultaneously. These included irrigation treatment, oxidation ponding, lagooning, and a rotating biological contactor process, in addition to a plant of 88% BOD removal with an activated sludge process. **ADVANCED WASTEWATER TREATMENT (IN JAPANESE),**
M. Shimodo, and Y. Okada.
Onoda Kenkyu Hokoku, (Research Reports of Onoda Cement Co.), No. 26, p 92-98, 1974. 11 fig, 9 ref.

Descriptors: *Waste water treatment, *Tertiary treatment, Nitrogen, Phosphorus, Lime, Precipitation(Chemical), Calcium carbonate, Calcium hydroxide, Inorganic compounds.

Advanced waste water treatment technology is utilized to remove pollutants which are not adequately removed by conventional secondary treatment processes. Such pollutants include soluble inorganic compounds (phosphorus, nitrogen) which may support algal growth in receiving water. Lime precipitation is the most useful technology for removal of phosphorus compounds from waste water. The chemical reactions of lime precipitation involve the condensed phosphate being readily hydrolyzed in the presence of Ca2+ and OH-. Calcium hydroxide then reacts with orthophosphate to precipitate calcium hydroxyapatite. As pH increases above 10.0, the precipitation of calcium hydroxyapatite increases, so that phosphate removal is improved with increasing pH. Also, calcium-hydroxide reacts with the bicarbonate alkalinity of waste water to form calcium carbonate and calcium hydroxide is regenerated. (Prague-FIRL)

**HUNTINGDON RESEARCH CENTRE PASVEER OXIDATION PLANT--SIX YEARS ON,**
Huntingdon Research Centre (England). Dept. of Building and Maintenance.
B. J. Spring, and E. R. E. Briscoe.
Public Health Engineer, Vol 14, p 35-39, March 1975. 4 tab.

Descriptors: *Waste water treatment, *Design criteria, *Activated sludge, *Oxygenation, Biochemical oxygen demand, Oxygen requirements, Oxidation lagoons, *Treatment facilities.
Identifiers: Oxidation channels.

The operation of the waste water treatment plant (Pasveer Oxidation Plant) at the Huntingdon Research Centre is described for the years following its installment in 1966. The capacity of the system to absorb heavy temporary overloading was established but the increased loading and greater sludge production increased the time required to clear the draw-off system and also increased the time required to draw-off the total volume, thus reducing the time available for oxygenation. The reduction of oxygenation time made additional oxidation capacity necessary. To meet the oxygen input requirement, a Flygt Pump, type CG 3605, was installed in May, 1971. In October, 1972, a new oxidation channel began operation. Several charts are included which show the average daily flow based on a 7-day week, the average daily flow based on a 5-day week, and the peak daily flow for every month in the years 1967 through 1973. The results of studies performed throughout 1968-1971 are presented in chart form. These include: BOD loading in terms of kg/d and percent of design limit; BOD in the raw waste, channel discharge, and final effluent; suspended solids in the raw waste, channel discharge, and BOD reduction overall in the channel discharge and final effluent. It is apparent from the records of the plant that there is no 'typical day' and that the volumes and characteristics of the waste vary considerably and do not follow any consistent pattern. The plant has had no odor problem of any kind and a recreational area is being planned for its surrounding land. (Orr-FIRL)

**INVESTIGATIONS ON THE LONG TERM BIOCHEMICAL OXIDATION OF SEWAGE,**
T. Stones.
Water Pollution Control, Vol 74, No 2, p 231-233, 1975. 2 fig, 1 tab, 16 ref.

Descriptors: *Sewage treatment, *Waste water treatment, *Biochemical oxygen demand, *Biodegradation, Nitrification, Nitrogen compounds, Organic compounds, *Oxidation.
Identifiers: *Biochemical oxidation.

The biochemical oxidation of sewage occurs in two broadly distinct stages, the first of which is attributed to the oxidation of the carbonaceous compounds present in the sewage, and the second to the oxidation of the nitrogenous matter present. However, the dichromate value of sewage which closely approximates the total carbonaceous oxygen demand greatly exceeds the first-stage BOD thus indicating that only part of the carbonaceous material is oxidized in the first step. Experiments performed determined that the remainder is inert to biochemical oxidation and is not oxidized along with the nitrogenous matter during the second stage. It was found that a second stage of biochemical oxidation of sewage is due to the fact that an induction period of about eighteen days (for the proliferation of the nitrifying organisms initially present) is necessary before nitrification can begin. This lag period is coincidental with the time required for the carbonaceous oxidation rather than caused by an inhibiting effect of carbonaceous matter on the nitrifying organisms as had been previously thought to be the reason for the lag time. T. Harpe, and D. Eichelsdoerfer
Vom Wasser, Vol 42, p 207-220, 1974. 7 fig, 3 tab, 10 ref.

Descriptors: *Humic acids, *Groundwater, *Waste water treatment. Water treatment, Organic compounds, *Filtration. Pilot plants, Aeration.
Identifiers: *Germany(Hamburg-Curslack).

Treatment of water containing humic acids must consider special problems. Humic acids were identified in order to study their reactivity under different treatment methods. Experiments on deep groundwater with a high content of humic acid from Hamburg-Curslack, Germany, are reported. Colloidal brown humic acids were identified. The colloidal form was highly unstable against air oxygen. Thus, experiments were conducted to eliminate the organic matter by filtration on a pilot plant scale. In a closed system, raw water was filtered after aeration, using different filter materials. Without additional flocculants, humic acids can be removed to 3% of their original content. (Prague-FIRL)

**OXIDATION OF ORGANIC COMPOUNDS IN WATER (OXIDATION ORGANISCHER VERBINDUNGEN IN WASSER),**
C. Bannert, and P. Speiser.
Vom Wasser, Vol 42, p 221-239, 1974. 3 fig, 12 tab, 14 ref.

Descriptors: *Oxidation, *Waste treatment, *Organic compounds, *Waste water treatment, Gas chromatography, Pollutant identification.
Identifiers: *Hydrogen peroxide.

The oxidative treatment of polluted water containing organic impurities is becoming increasingly important. The oxidative degradation of all organic material to carbon dioxide was studied by treating pure organic compounds (serving as models for common impurities) with hydrogen peroxide. The organic compounds were treated in aqueous solution for 15 minutes at 150, 225, and 300C with hydrogen peroxide in the presence of catalysts. The optimum oxidation was found to occur in the 5 pH range and at 225C. Temperature increase to 300C as well as greater than stoichiometric additions of hydrogen peroxide were found to achieve no better oxidation effects. The concentration of the organic pollutants had no influence on the oxidation effect in the range investigated. The organic residuals were measured by gas chromatography as total organic carbon. 1975. 1 tab, 3 ref.

Descriptors: *Waste water treatment, *Sewage treatment, *Nitrogen, Organic compounds, Ammonia, Settling basins, Treatment facilities.
Identifiers: Organic nitrogen.

It is known that there is a reduction in organic nitrogen during settlement of sewage. Two theories to account for this phenomena are that the reduction is due to biological activity, independent of settlement, or that reduction is due to conversion of part of the organic nitrogen to ammonia. In a test, the amounts of ammoniacal and organic nitrogen present were determined for samples of sterilized and unsterilized sewage, both fresh and when 18 hours old. On the average organic nitrogen was reduced by 48.8% during settlement for 18 hours. However, 32.5% of this was independent of settlement, implying that only was actually due to deposition. An increase

in the amount of ammoniacal nitrogen
t was clearly due to the decomposition of
nous organic matter. The resulting reduc-
the total amount of nitrogen effected by set-
was only about 8%. As there was no
in nitrogenous constituents of sterilized
s, the effects of biological activity are con-

**CHEMICAL-BIOLOGICAL TREATMENT WITH BIOLOGICAL FILTERS,**
Salisbury City Engineer's Dept. (Rhodesia).
A. B. Neeley.
Water Pollution Control, Vol 74, No 2, p 160-165, 1975. 2 ref.

Descriptors: *Biological treatment, *Waste water treatment, *Lime, Pilot plants, Capital costs, Filters, Phosphates, Denitrification, Operation, Sludge treatment, Treatment facilities, Africa.
Identifiers: Phosphate removal, Recarbonation, *Rhodesia.

Pilot scale experiments with lime addition at the primary stage of a conventional works is discussed. The objective of the study was to find a process which could initially be used on a seasonal basis, requires little capital expenditure, and can be used with existing treatment facilities. A pilot facility was tested at Salisbury, Rhodesia, after laboratory study. Lime precipitation with recarbonation enabled the filter to work well. Costs for lime storage, dosing, and pH control were low; major capital expenditure would be necessary only if denitrification, suspended solids removal and sludge recalcining were needed. It was concluded that conventional biological filter plants could be converted for phosphate removal at low cost, without excessive revenue expenditure. Under certain circumstances, it might be economic to use lime to reduce overload on a works rather than to extend it. If phosphate removal was needed on an overloaded works, the process would be very economical. Effluents from this system would be well suited to treatment by denitrification. Because necessary installation would not interfere with normal operation, the system is applicable for seasonal use in conjunction with a farm. (Prague-FIRL)

Descriptors: *Waste water treatment, *Aerators, *Activated sludge, Oxygen, Municipal wastes, Industrial wastes, Aeration, Equipment, Biological treatment, Treatment facilities.

A blast nozzle aerator and its use for the aeration of activated sludge in biological waste water treatment plants is described. Blast nozzles are placed horizontally near the bottom of the aeration tank. These blow air, oxygen-enriched air, or oxygen into the water, while performing a rotary motion due to the tangential arrangement of the nozzles. The rotary motion provides for necessary circulation of the water. At an immersion depth of 1.6 m, the oxygen input ranges from 1.5 to 2.5 kg of dissolved oxygen per kWh, while nozzles with 4 m immersion reach oxygen inputs over 4 kg/kWh. The blast nozzles are equally suitable for the aeration of municipal and industrial waste water. (Takacs-FIRL)

Identifiers: Vacuum filters, Band press.

Sludge from biological purification can be dewatered in several steps and by equipment with varying costs and operating properties. On the basis of experimental results, capital costs, and operating costs, the influence of flocculant consumption on the dewatering costs is examined for the vacuum filter, the band press, and the centrifuge. If costs for the various dewatering apparatuses are calculated to include subsequent incineration, they will depend upon whether organic or inorganic flocculants or filtering agents are used for conditioning. For example, if use of an organic flocculant in a centrifuge is followed by a fluidized bed furnace, the costs for the mechanical dewatering stage increase, due to rising flocculant consumption. The decrease of the incineration costs slows down with increasing flocculant consumption. A low cost minimum is obtained at a specific flocculant consumption of 2.9 g/kg dry substance. For the vacuum filter and the filter press no cost minimums exist. The lowest costs are obtained when the minimum filtering agent is required to remove the cake from the filter cloth or the filter press is added. (Nave-FIRL)

**DESIGN CONSIDERATIONS--WATER AND EFFLUENT DISPOSAL,**
W. E. Brand.
Institute of Food Science and Technology, Vol 7, No 2, p 130-137, June 1974.

Descriptors: *Effluents, *Sewers, *Water pollution, *Sludge disposal, Industrial wastes, Rivers, Water quality, Management, Waste water treatment, Activated sludge, Domestic sewage.
Identifiers: Sewerage Bill of 1968(Scotland).

A Sewerage Bill was introduced into Parliament in 1968, with Part II of the bill concerning trade effluent in accordance with the recommendations of the Hill Watson Committee. According to this act, the local authority is compelled to 'provide public sewers to effectively drain their area domestic sewage, surface water and trade effluent and also provide sewage treatment works to effectively deal with the contents of the sewers'. The local authority has jurisdiction over conditions relating to the sewers into which trade effluent may be discharged; the nature and composition of all trade effluent, maximum quantity and hourly rate, the prohibition of any constituent of any trade effluent which may be detrimental to the operation of the sewers, and the provision of inspection chambers. In regard to water quality control, bacteriological quality, suspended matter, organic matter, dissolved gases and dissolved solids are the salient headings. Effluent standards are dependent upon the place of the trade effluent discharge. Standards applied to effluents being discharged into rivers are much more strict than the normal limit of less than 20 ppm BOD and 30 ppm suspended solids. More stringent pH and temperature limits are also enforced. Regulations of discharge to tidal waters would be less strict than discharge to a river. (Leibowitz-FIRL)

**WATER QUALITY CONTROL IN SEWAGE WATER TREATMENT, (IN JAPANESE),**
E. Fujimoto, N. Sato, and T. Sekine.
Meiden Jiho (Meiden Riview), Vol 5, No 118, p 40-48, 1974.

Descriptors: *Water pollution control, *Waste water treatment, *Sewage treatment, Aeration, Instrumentation, *Model studies, Equations, Biochemical oxygen demand, Water quality control.

To control the operation of sewage treatment plants, mathematical equations are proposed for individual treatment units, such as the sand-precipitation pond, aeration tank, sterilization pond, sludge concentration bath, and sludge feedback system. The model equations reflect the water qualities at each individual unit as well as quantitative conditions appearing at each unit. The equations are to be used by computers to predict better quality, rather than quantity, control in sewage plants. For example, the equation to control air amounts supplied to aeration tanks is expressed as the function of amount of sewage water, oxygen mobility (which is a function of temperature), oxygen dissolution efficiency, BOD value, MLSS value in aeration tank, and aeration tank capacity. Therefore, to regulate the air amount in the aeration tanks, the measurements of amount of BOD, MLSS values, and dissolved oxygen are all necessary. The use of model equations for computer quality control will be applicable to sewage plants with future developments in sensoring instrumentation. (Katayama-FIRL)

Descriptors: *Waste water treatment, *Surfactants, *Detergents, Domestic wastes, Sewage treatment, Toxicity, Legislation, Foreign research, Environmental effects, Biological treatment, Anaerobic digestion, Water pollution control.
Identifiers: Tensids(Syndets), Germany.

Surface active agents in sewage originating mostly from household detergents are an important factor in the determination of environmental influences on man, with special reference to the water supply. The current German legislation on detergents considers the problems in a comprehensive sense including the overall toxicity via and in the water system. The recent literature on toxicological values for warm-blooded animals and aquatic organisms such as sewage degrading bacteria and the influence of chemical structure is discussed. The toxicity of surfactants to a biological sewage treatment system including the effects on anaerobic digestion is considered to be of special importance. Successful control of environmental pollution caused by surfactants in the water can be achieved by the use of adequate sewage treatment. (Orr-FIRL)

**INTERACTIONS OF HEAVY METALS IN THE ACTIVATED SLUDGE PROCESS,**
Illinois Inst. of Tech., Chicago.
M. H. Cheng.
Available from University Microfilms, Inc., Ann Arbor, Michigan, 48106, Order No 74-16992. PhD Thesis, 1973, 221 p.

Descriptors: *Activated sludge, *Heavy metals, *Waste water treatment, *Toxicity, Biological treatment, Sludge, Waste treatment, *Chemical reactions, Ions.
Identifiers: Freundlich equation, Langmuir Isotherm, Metal ions.

Although many reports on the toxic effects of heavy metals on biological wastes treatment processes have appeared in the literature, little is known about the physical-chemical interactions within the process between the sludge mass and dissolved metal ions. The kinetics of heavy metals uptake by activated sludge, the ability of the sludge to concentrate metal ions from waste water and the affinity of the sludge mass for metal ions were investigated. Metal uptake by the sludge was dependent upon such factors as pH and the concentrations of sludge, soluble supernatant organics, and metal ions present in the system. Binding capacity appeared to increase with increasing pH, and higher initial concentration of either metal ions or MLSS also augmented the uptake efficiency. If the proper conditions are present the sludge can concentrate heavy metals up to 2 percent or more (by weight) of the sludge mass, even at low initial soluble metal levels. Good correlation was found between the metal uptake by activated sludge and the expression of Freundlich or Langmuir Isotherm. At high initial metal concentrations, the metal ions precipitate and are entrapped within the biological floc of the activated sludge system. At lower metal concentrations, the metals are taken up by the biomass through other mechanisms, such as physical adsorption, complexation and diffusion. (Orr-FIRL)

Identifiers: Control theory, Control charts, Sen sitivity, Autocorrelation, Cost minimization.

Statistical monitoring should be used more exte sively in pollution control. Monitoring is prerequisite for control; it is needed to discov how much control is required or how effective a plied controls have been. The design of an effe tive monitoring system requires balancing the pr tection purchased against the cost. An approach this problem is outlined using a simple cont chart to determine protection afforded. A simp system behavior/cost model is developed that cludes a penalty for polluting as the incentive purchase protection. Specifically, a compron between daily treatment plant monitoring and monitoring is explored. The economic sensitiv of the simple cost function derived from basic c trol theory is examined to ascertain how m sampling gives a good balance between efflu monitoring cost and assurance of being in co pliance with an effluent standard. The statis used indicate a near optimal sampling interval or 4 days; this gives a reasonable compron which provides protection but will not overbur a small operation financially. This analysis p vides a framework that small plants (where o the cost-benefit relationship is unclear) and reg tory agencies may use to consider rationally motivation for and implementation of enforcem programs. Descriptors: *Waste water treatment, Water quality control, *Treatment facilities, *Statistical methods, *Temporal distribution, *Distribution patterns, Probability.
Identifiers: Spectral analysis.

Six wastewater treatment plants in Nevada were analyzed for resultant effects on receiving water body quality caused by temporal variability of sewage effluent quality. The variation of the peak hourly flows caused by population was examined with efforts to develop an empirical equation usable for future planning of sewage collection works. The probability distributions of a variety of variables such as hourly influent flow, daily flow, influent and effluent biochemical oxygen demand and suspended solids, and in some instances, phosphate concentrations, were investigated. Results showed the significance of expressing treatment effectiveness in terms of statistical parameters rather than average values only. The study also revealed periodicities exist in a multitude of variables associated with the municipal wastewater treatment facilities. Engineering and scientific principles rather than purely empirical considerations should govern the design and operation of plant facilities. (Fallon-Nevada)

**WASTE WATER SURVEY, ST. REGIS PAPER COMPANY, CANTONMENT, FLORIDA.**
Environmental Protection Agency, Athens, Ga. Surveillance and Analysis Div.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-228 275, $4.25 in paper copy, $2.25 in microfiche. August 1972. 52 p, 4 fig, 4 ref, 14 tab.

Descriptors: *Pulp wastes, *Waste water treatment, *Treatment facilities, *Evaluation, Water pollution sources, Wastes, Industrial wastes, Biochemical oxygen demand, Chemical oxygen demand, Suspended solids, Lignins, Color, *Florida, Ammonia, Phosphorus compounds, Nutrients, Settling basins, Aerated lagoons, Sewage treatment, Nutrient removal, Water pollution treatment, Water pollution control, Waste water(Pollution).
Identifiers: Total organic carbon, Kraft mills, Phosphoric acid, Perdido Bay(Fla), Elevenmile Creek(Fla), Bleached paper, Kraft paper, Perdido Bay Federal-State Enforcement Conference.

An evaluation is presented of waste treatment at St. Regis Paper Company's integrated kraft pulp and paper mill located at Cantonment, Florida. Reported results are from a 1972 study which was requested by the conferees at the Perdido Bay Federal-State Enforcement Conference Progress Meeting held in Gulf Breeze, Florida, during January, 1972. The field study was designed to determine the waste removal effectiveness of the mill's waste treatment facilities and to characterize the wastes discharged. Daily production during the survey averaged 830 tons of kraft pulp (543 tons of unbleached and 287 tons of bleached) and 785 tons of bleached and unbleached paper. Approximately 29 million gal/day of liquid wastes generated at the mill are discharged into Perdido Bay via Elevenmile Creek. The treatment facilities include a primary settling basin, nutrient feed system (anhydrous ammonia and phosphoric acid), three aeration ponds, and a final settling pond. Riffle terraces are located before and after the final pond. Waste loads and concentrations before and after treatment and percent reductions are as follows: BOD, 45,000 lb/day (210 mg/liter) and 4,050 lb/day (17 mg/liter), 91%; total organic carbon, 57,500 lb/day (264 mg/liter) and 29,300 lb/day (122 mg/liter), 49%; COD, 175,000 lb/day (814 mg/liter) and 83,400 lb/day (352 mg/liter), 52%; lignin-like compounds, 19,600 lb/day (91 mg/liter) and 17,300 lb/day (73 mg/liter), 12%; and color (Pt-Co units), 1,290 mg/liter and 1,100 mg/liter, 15%. About 90% of the total suspended solids load (49,200 lb/day) and total volatile suspended solids (30,000 lb/day) are removed in the treatment system. All of the N and P added by the nutrient feed system was not assimilated. (Witt-IPC)

Available from the National Technical Information Service, Springfield, Va 22161 as NASA-CR-120303, $3.75 in paper copy, $2.25 in microfiche. Summary Report for Phase III. April 1974. 40 p, 14 fig, 2 tab. Project No 1528. NAS 8-27467.

Descriptors: *Distillation, *Urine, *Water reuse, Potable water, Wastes, *Waste water treatment, Condensation, Water vapor, Gravity, Testing, Liquid wastes, Liquids, Equipment, *Filtration, Domestic wastes.
Identifiers: Human wastes, *Vacuum systems, Space technology.

Research activities preparatory to conducting low-gravity tests of a vacuum distillation/vapor filtration (VD/VF) system for recovering water from urine and humidity condensate are described. The VD/VF system comprises an evaporator, catalytic oxidation unit, and condenser, as well as auxilliary heat exchangers, valves, pumps, and controls. The evaporator boils urine and condensate into raw vapor, the catalytic oxidation unit removes organic contaminants and bacteria from the vapor, and the condenser condenses the vapor into potable water. A schematic flow diagram of the VD/VF system is given. Preparations for low-gravity testing described include analysis of liquid motion inside the evaporator during parabolic flights; installation of a transparent top on the evaporator and liquid deflectors within the evaporator; design of supports for VD/VF system components; design of a cooling unit; modification of various components, including sludge removal pump, drive motor and speed reducer for evaporator impeller, and oil-less vacuum pump; and frame fabrication and system assembly. The present status of low-gravity test preparations is assessed. (Witt-IPC)

**POLLUTION ABATEMENT IN A BREWING FACILITY.**
Environmental Protection Agency, Washington, D.C. Technology Transfer Staff.
EPA Technology Transfer Capsule Report No. 6, (1974). 17 p, 8 fig, 6 tab.

Descriptors: *Waste water treatment, *Treatment facilities, Biochemical oxygen demand, Suspended solids, Wastes, Industrial wastes, Water pollution sources, Water pollution treatment, Water pollution control, Capital costs, Operating costs, Costs, Water conservation, Byproducts, Sludge, *Colorado, Sewage treatment, Neutralization, Waste treatment, Activated sludge, Biological treatment, Food processing industry.
Identifiers: *Brewing industry, Hatfield process.

The brewing process and waste water treatment at Adolph Coors Company (Golden, Colorado) are described. Wastes generated from the combined brewing and malting operations amount to 3.3 million gal/day at a BOD level of 825 mg/liter. This is less than one-half the waste load produced by average breweries without malting facilities. The waste treatment facility provides primary treatment through neutralization and solids removal, and secondary treatment through a high-rate activated sludge system using a modification of the Hatfield process. Suspended solids are reduced by 90%, from 280 mg/liter to 29 mg/liter, and BOD is reduced by 96% to 34 mg/liter. Coors has realized sizable savings in the capital and operating costs for its waste treatment facility by reducing the raw wastes from the brewing plant through a program of water conservation, in-plant waste reduction, and recovery of waste materials as by-products. Preliminary feeding tests have shown that the dried sludge can be used as a high protein animal feed supplement. (Witt-IPC)

T CHARACTERISTICS AND TREAT- OF MECHANICAL PULPING EF-
,
rch, Vancouver(British Columbia).
ard, and C. C. Walden.
al Mechanical Pulping Conference, San June 16-20, 1975, (Preprinted s, TAPPI, Atlanta, Ga.), p 197-201. 1 tab.

s: *Pulp wastes, *Biochemical oxygen Toxicity, *Fish, Rainbow trout, Indus- s, Wastes, Water pollution sources, ution effects, Water pollution, Aerobic Activated sludge, Waste water treat- culation, Waste treatment, Water pollu- , Lagoons, Economics.
*Mechanical pulping, *Total organic

This study assessed the 5-day BOD, total organic carbon, and toxicity to fish of mechanical pulping effluents where the effluent is not contaminated by barking wastes or brightening aids. The raw effluent was toxic to rainbow trout with the median tolerance limit, 96 hr-LC(50), normally between 4-10% (volume/volume) and the median survival time in 65% concentration frequently as low as 20 minutes. The BOD ranged from 300 to 1400 mg/liter and the total organic carbon was about 400 mg/liter. Aerobic microbiological fermentation either in activated systems or in 5-day lagoon systems reduced the BOD by as much as 97% and total organic carbon correspondingly. All systems effectively detoxified the waste unless activity was limited by temperature, as in the case of a system operated at 1 C. Flocculation was not effective. The economics of treatment are discussed briefly as are the interrelationships of effluent characteristics. The only useful relationship was between 5-day BOD and total organic carbon. (See also W75-11332) (Witt-IPC)

**MILL EXPERIENCE IN THE TREATMENT OF MECHANICAL PULPING EFFLUENT,**
B.C. Research, Vancouver (British Columbia).
T. E. Howard, R. G. Leslie, and N. E. Ward.
International Mechanical Pulping Conference, San Francisco, June 16-20, 1975 (Preprinted Proceedings, TAPPI, Atlanta, Ga.), p 202. 1 fig, 1 tab.

Descriptors: *Pulp wastes, *Waste water treatment, *Aerobic treatment, *Biological treatment, Lagoons, Oxidation ponds, Biochemical oxygen demand, Toxicity, Winter, Seasonal, Heating, Natural gas, Temperature control, Industrial wastes, Wastes, Water pollution sources, Water pollution treatment, Water pollution control, Foreign countries, Canada.
Identifiers: *Mechanical pulping, Finlay Forest Industries Ltd.(Canada).

Refiner-groundwood pulping effluent at Finlay Forest Industries Ltd. (Mackenzie, British Columbia) is treated by an aerobic microbiological system (consisting of a primary lagoon, 3-day aerated stabilization basin, and final aeration lagoon) to reduce BOD and remove toxicity. Detoxification of the effluent during winter months (November-February) has been improved by installing submerged natural gas heaters ahead of the 3-day lagoon to maintain the temperature of the effluent around 18 C. (See also W75-11331) (Witt-IPC)

Identifiers: *Hungary, Corn stalks, Kraft mills, Groundwood mills, Writing papers, Printing papers.

The pulp and paper complex at Dunaujvaros includes a 22,000 ton/year kraft pulp mill processing corn stalks, a 15,000 ton/year groundwood mill, and a 70,000 ton/year writing and printing paper mill. Plans call for the installation of a semichemical pulp mill, a linerboard and corrugating medium machine, and a box plant in 1976. Internal measures for reducing pollution at the complex are outlined, including the planned chemical cross-recovery system. A description is presented of the effluent treatment system being developed, which includes physical-chemical clarification plus biological purification (activated sludge aeration plus secondary clarification). Sludge thickening and filtration procedures are also mentioned. (Speckhard-IPC)

**SOLUTE-SOLUTE INTERACTIONS IN ULTRAFILTRATION TREATMENT OF PAPER MILL WASTES,**
North Carolina State Univ., Raleigh. Dept. of Chemical Engineering.
H. B. Hopfenberg, V. T. Stannett, and M. W. Bailey.
American Institute of Chemical Engineers, Symposium Series, Vol 70, No 139, p 1-10, 1974. 14 fig, 22 ref, 1 tab.

Descriptors: *Waste water treatment, *Reverse osmosis, *Inorganic compounds, Industrial wastes, Wastes, Water pollution sources, Membrane processes, Separation techniques, Waste treatment, Membranes, Water pollution treatment, Water pollution control, Electrolytes, Gels, Permselective membranes.
Identifiers: *White water, *Starch, Cellulose acetate membrane.

The effect of interactions between starch and various inorganic salts on flux-limiting phenomena in the ultrafiltration of salt-starch-water solutions was studied. These ternary solutions were formulated to model a paper mill white water and contained a commercial papermaker's oxidized starch and one of several salts (sodium chloride, sodium sulfate, magnesium chloride, magnesium sulfate, aluminum chloride, or aluminum sulfate). The test loop employed an Eastman Chemicals KP-90 asymmetric cellulose acetate membrane. The results showed a reduction in product flux of up to 70% from the pure water flux when a starch-salt solution was treated, indicating that process equipment may be undersized by a factor of 4 if these flux-limiting interactions between solutes are ignored. In an aqueous solution of oxidized starch, the starch chain is in an expanded configuration, due to repulsion of like charges from the ionized COOH groups along the chain. By adding an electrolyte, the charges on the chain are shielded by the counterions, allowing the polymer chain to coil more densely. The shielded starch molecules form less viscous solution and, ultimately, a denser gel than they would without shielding. Gel formation on the membrane surface caused by the preferential accumulation of starch at the solution-membrane interface adds an additional resistance to water transport through the membrane. The interaction between starch and salt is a consequence of the charge on the polymer, and the resistance to water transport was shown to increase with increasing concentration of starch and/or salt and with decreasing charge frequency on the starch molecule. (Witt-IPC)

**EVALUATION OF THE ADSORPTIVE PROPERTIES OF FLY ASH WITH REFERENCE TO A PULP AND PAPER MILL WASTE EFFLUENT,**
National Council of the Paper Industry for Air and Stream Improvement, Inc., New York.
R. C. Whittemore.
U.S. Bureau of Mines, Information Circular IC 8640, p 296-317, 1974. 50 ref, 14 tab.

Descriptors: *Fly ash, *Bleaching wastes, *Color, *Waste water treatment, Biochemical oxygen demand, Chemical oxygen demand, Wood wastes, Bark, Water pollution sources, Wastes, *Industrial wastes, Water pollution treatment, Water pollution control, Lime, *Waste treatment.

The adsorptive properties of fly ash from boilers that burned wood wastes and bark along with auxiliary fuels (oil and gas), from a coal-burning boiler, and from coal- and bark-fired boilers were studied. The results showed that the fly ash in general did not have conventional adsorptive properties comparable to a commerical-grade activated carbon. Softwood-bark-derived fly ash adsorbed iodine and phenol better than the hardwood-bark-derived fly ash. The study also indicated that the ability of a fly ash to be used effectively in the treatment of a particular pulp and paper mill waste was proportional to its lime (CaO) content. Hardwood bark fly ash had a high lime content and was most effective in removing caustic bleaching effluent color, COD, and 5-day BOD. (Witt-IPC)

**MEASURES IN THE SULFITE PULP INDUSTRY FOR DECREASING WASTE WATER LOAD (MASSNAHMEN DER SULFITZELLSTOFF-INDUSTRIE ZUR MINDERUNG DER ABWASSERBELASTUNG),**
Chemiefaser Lenzing A.G. (Austria).
R. Hornke, and H. Danninger.
Das Papier, Vol 29, No 6, p 241-245, June, 1975. 5 fig, 3 ref, 1 tab.

Descriptors: *Pulp and paper industry, *Waste water treatment, *Water pollution, Sulfite liquors, Bleaching wastes, Industrial wastes, Wastes, Water pollution sources, Neutralization, Biological treatment, Biochemical oxygen demand, Water pollution control, Water pollution treatment.
Identifiers: Chemiefaser Lenzing AG.(Austria), Austria, Evaporator condensates, Sulfite mills.

Following a short review of the origins of waste water loads during the operation of a sulfite pulp mill, measures being taken or planned at the mill of Chemiefaser Lenzing AG. (Austria) are described. A differentiation is made between measures for digester discharge, condensates from spent liquor evaporation, and bleach plant effluents. The target is a spent liquor retention of 99.3%, neutralization of evaporator condensates, and treatment of the bleaching waste water in a biological or other decomposition stage, with the desired result of a total discharge of only 6 tons or 5-day BOD per day. (Speckhard-IPC)

**EFFECT OF LIME TREATMENT ON MOLECULAR WEIGHT DISTRIBUTION OF COLOR BODIES FROM KRAFT LINERBOARD DECKER EFFLUENTS,**
Institute of Paper Chemistry, Appleton, Wis.
H. S. Dugal, J. W. Swanson, E. E. Dickey, and M. A. Buchanan.
Tappi, Vol 58, No 7, p 132-135, July, 1975. 4 fig, 12 ref, 4 tab.

Descriptors: *Pulp wastes, *Lime, *Color, *Waste water treatment, Industrial wastes, Wastes, Water pollution sources, Water pollution treatment, Waste treatment, Effluents, Solubility, Pulp and paper industry, Freeze drying.
Identifiers: *Molecular weight, Decker effluents, Kraft linerboard, Total organic carbon, Sugars, Board mills.

Concentrated aqueous solutions of freeze-dried solids from kraft linerboard decker effluents (before and after lime treatment) were acidified to give acid-insoluble and acid-soluble fractions in experiments designed to allow the isolation and characterization of the colored components of dilute kraft waste liquors. About 63% color was obtained as an acid-insoluble fraction when the effluent not treated with lime was acidified, and only 26% when lime-treated effluent was acidified. Lime treatment removed approximately 86% of the color, 57% of the total organic carbon, and 17% of the reducing sugars from the decker effluent. Apparent weight-average molecular weights of the acid-insoluble color bodies before lime treatment varied from less than 400 to 30,000 and after lime treatment from less than 400 to 5,000. Acid-soluble color bodies, before and after lime treatment, ranged from less than 400 to 5,000. Color bodies having a weight-average molecular weight of less than 400 were not removed by lime treatment, and those above 5,000 were completely removed. Color bodies in the intermediate range (weight-average molecular weight 400-5,000) were apparently partially removed. (Sykes-IPC)

Descriptors: *Sulfite liquors, *Flocculation, *Waste water treatment, *Flotation, Industrial wastes, Wastes, Water pollution sources, Waste treatment, Water purification, Water pollution, Water pollution control, Efficiencies, Effluents, Regression analysis, Europe, Pulp and paper industry.
Identifiers: Sodium aluminate, Polyacrylamide, Polyamide-amine, Sulfite pulp mills, Finland.

Effluents from a Finnish calcium-base sulfite mill were subjected to purification by chemical flotation. The effects of different flocculants (sodium aluminate, polyacrylamide, polyamide-amine) and other variables (water pH, air content, surface loading, retention tank pressure, coagulant dosage) on the efficiency of the flotation plant were analyzed by regression techniques. Type of flocculant was found to have the greatest effect. Best results under the particular operating conditions of this installation were obtained with polyacrylamide. Sodium aluminate was better than no flocculant, but was sensitive to pH variations and required a high retention tank pressure. The polyamide-amine used was not particularly effective. (Brown-IPC)

Paperi ja Puu, Vol 57, Special Issue No 4a, p 23238, 241-244, April, 1975. 6 fig, 11 ref, 5 tab. English summary.

Descriptors: *Waste water treatment, *Electrochemistry, *Colloids, Industrial wastes, Pulp and paper industry, Wastes, Water pollution sources, Waste treatment, *Flocculation, Water purification, Suspended solids, Neutralization, Stabilization, Electric fields, Anodes, Corrosion control, Corrosion, Steel, Effluents, Water pollution control, Water pollution, Water pollution treatment, Foreign research, Europe, Chemical wastes.
Identifiers: *Finland.

Effluents of forest, chemical, and metal-working industries often contain colloidal particles difficult or impossible to remove by normal treatments. In a 1970 study of cathodic protection of steel against corrosion by pulp mill waste waters, sudden clarification with flock formation was noticed in dark waste waters containing much suspended solids. Charge neutralization and stabilization of colloids by the strong electric field was suspected, but the phenomenon was nonreproducible. Studies resumed in 1974 at the Metallurgy Department of Helsinki's Technological University indicated that the electric field along could not stabilize the colloids, but that conditions suitable for neutralizing the colloids could be achieved by simultaneous anodic dissolution of Al or Fe flock. (Brown-IPC)

**ORGANIC COLOR IN GROUNDWATER OF MISSISSIPPI,**
Mississippi State Univ., Mississippi State. Dept. of Civil Engineering.
M. T. Bond, and J. E. Bowie.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-244 507, $4.25 in paper copy, $2.25 in microfiche. Mississippi Water Resources Research Institute, Mississippi State, Completion Report, July 1975. 56 p, 12 fig, 4 tab, 16 ref, 7 append. OWRT A-084-MISS(1).

Descriptors: *Color, Water quality, Groundwater, Water supply, *Mississippi, Water wells, Polyelectrolytes, Waste treatment, *Water treatment, Hydrogen ion concentration.
Identifiers: Organic color.

The objectives were to identify the substances in groundwater that produce organic color and to evaluate techniques to remove the color from water supplies. Eight wells having very little or no iron content were selected as sampling sites for preliminary characterization studies. Organic colors ranged from 15 units to 140 units. All samples had a pH between 8.3 and 8.7. An analysis of the color material in the water strongly indicated that it was a tannin and lignin like substance. A near linear correlation exists between tannin and lignin concentrations and color units in water. Organic color could be removed from groundwaters most effectively by adjusting the pH downward and adding alum and a polyelectrolyte at a proper dosage. Alum requirements were 60-70 mg/l for all waters at a pH of approximately 6. The polyelectrolyte requirements varied with the intensity of color. Activated carbon is not an effective method to remove organic color greater than 40, and possibly much lower, from groundwater. It may be effective to remove residual color after chemical physical treatment.

**LIQUID CO2 PROTECTS OUR WATER'S QUALITY,**
Kansas City Water Dept., Mo.
D. R. Boyd.
The American City, Vol 90, No 1, p 57-58, March, 1975. 2 fig.

Descriptors: *Water quality, *Carbon dioxide, *Water purification, Costs, Lime, Flow rates, *Water treatment, Missouri, Waste water treatment.
Identifiers: *Recarbonization, Kansas City(Mo).

The Kansas City, Missouri, Water Department utilizes recarbonization as an essential step in their water purification method. This step is used to neutralize and stablize the water after it has been softened with lime. In the past the Kansas City plant produced their own carbon dioxide with on-site generators. They are now using commercial carbon dioxide. The advantages of using liquid carbon dioxide are cost, superior purity and quality of gas, no contamination of the water, shorter filter runs, and prevention of carbon monoxide formation. The Kansas City plant processes an average of 105 mgd with a high of 178 mdg and low of 85 mgd using an average of 339 pounds of carbon dioxide vapor per million gallons of water for recarbonization. The liquid carbon dioxide is stored in 4 fiberglass insulated refrigerated low-pressure tanks with a 24-ton capacity each. In the recarbonization basins the water passes in an undulating motion over and under a series of transverse verticle baffles. The excess alkalinity of the water is neutralized to a pH of 9.7 by the carbon dioxide. (Dean-FIRL)

**A WATERBORNE GASTROENTERITIS EPIDEMIC IN PICO RIVERS, CALIFORNIA,**
Los Angeles County Health Services Dept., Calif. Immunization Project.
L. E. Mahoney, C. T. H. Friedmann, R. A. Murray, E. L. Schulenburg, and G. A. Heidbreder.
American Journal of Public Health, Vol 64, No 10, p 963-968, October 1974. 3 fig, 4 tab, 10 ref.

Descriptors: *Public health, *Epidemics, *Chlorination, *Water supply, Reservoirs. Coliforms, *California, Water treatment, Water pollution effects.
Identifiers: *Sewage poisoning, Fecal coliform, Gastroenteritis, Pico Rivera(Calif).

An outbreak of acute nonspecific gastroenteritis occurred between July 29 and August 7, 1971 when about 11,000 residents of Pico Rivera, California, became ill. Symptoms included diarrhea, stomach cramps, nausea, vomiting, fever, and menatochezia. These symptoms are compatible with the syndrome of sewage poisoning. Sanitary and epidemiology investigations determined that the source of the illnesses was water from a reservoir serving part of the town. Chlorination at the reservoir was interrupted for about a week starting July 29, 1974 due to an unattended chlorinator that was out of chlorine. The area served by the reservoir showed heavy fecal coliform contamination in water samples taken. The contamination was further localized to a portion of the water line. Although the common feeling is that waterborne gastroenteritis outbreaks in the United States are things of the past, current statistics suggest that common source outbreaks of waterborne disease may continue to occur with some frequency. (Orr-FIRL)

**INDUCED INFILTRATION SUPPLY SYSTEM AMONG BIGGEST.**
Water and Pollution Control, Vol 112, No 9, p 33, 38-39, September 1974. 2 fig.

Descriptors: *Water supply, *Aquifers, *Infiltration, Water resources, Pumps, Costs, *Canada, Water treatment, Facilities, Construction.
Identifiers: *Fehlmann collector, *Induced infiltration.

An induced infiltration supply system including pump house for a water supply system has recently been installed for the City of Prince George, British Columbia. The system cost around $1.2 million which was a 44% saving over the estimated cost of a river intake and treatment plant. In addition to the capital cost saving, there will be annual operating cost savings in the form of chemical treatment, operation and maintenance costs associated with surface water treatment plants. The completed project includes a Fehlmann collector, one of the highest capacity ground water collectors in the world. An investigation was done to

determine the best method of supplying water which included drilling and logging test wells, constructing temporary pumped wells, and aquifer testing an extensive glacial outwash area along the Nechako River. The Fehlmann collector is guaranteed to produce a minimum of 10 mgd up to a maximum of 15 mgd. The collector consists of a 16 ft inside diameter caisson of reinforced 4000 psi high early strength concrete with 1.5 ft thick walls and a bottom of 6 ft thick reinforced concrete. Other specifications and details of construction and operation are given. (Orr-FIRL)

**BIOLOGICAL CONTROL: ISOLATION AND BACTERIAL OXIDATION OF THE TASTE-AND-ODOR COMPOUND GEOSMIN,**
Detroit Univ., Mich. Dept. of Biology.
L. V. Narayan, and W. J. Nunez.
Journal of the American Water Works Association, Vol 66, No 9, p 532-536, September, 1974. 6 fig, 2 tab, 13 ref.

Descriptors: *Biodegradation, *Odor-producing algae, *Odor, *Bacteria, Taste, Water quality, Biological treatment, *Biocontrol, Microbial degradation, Oxidation, Microorganisms, Isolation, Water supply.
Identifiers: Bacillus sp, *Geosmin, Anabaena circinalis.

A variety of microorganisms have been cited as the causes of naturally occurring tastes and odors in water supplies. The two most important of these microbial odor causing compounds are mucidione and geosmin. The isolation of geosmin from Anabaena circinalis, determination of the threshold odor level, enrichment culturing of microorganisms, cell cultivation and collection, and oxidative degradation were studied. Geosmin was found to be the primary odor component in Anabaena circinalis. The distillation and extraction of the entire algal culture of Anabaena circinalis, cells and medium, yielded more geosmin than distilling the algal cells along. The geosmin in the medium was probably the result of a release of metabolites during physiological transitions of the algal culture. Manometric oxidation studies were found to be useful for scanning microorganisms as agents for controlling taste and odor compounds in water. Sarcina sp., Micrococcus sp., Mima sp., Escherichia coli, Alcaligenes viscolactis, and Bacillus sp. were all examined in regard to their ability to degrade geosmin. Bacillus sp. appeared to be the best bacterial organisms for biological control of odor causing metabolites. Bacillus cereus strain 10876 has previously been reported as the best strain of bacteria for the degradation of geosmin. However, Bacillus subtilis strains and Bacillus cereus strain ATCC 9139 proved to be as effective as Bacillus cereus strain 10876 in degrading geosmin. (Orr-FIRL)

**CITY/TOWNSHIP JOINT VENTURE--A NEW WATER PLANT,**
East Lansing-Meridian Water and Sewer Authority, East Lansing, Mich.
W. K. Kyes.
Water and Sewage Works, Vol 232, No 8, p 88-91, August, 1974. 3 fig.

Descriptors: *Water treatment, *Water supply, *Domestic water, Water softening, Hardness(Water), Water purification, Water wells, Filters, Treatment facilities, *Michigan.
Identifiers: East Lansing(Mich), Meridian Township(Mich).

The East Lansing-Meridian Water and Sewer Authority was formed in 1969 to provide a sufficient quantity of fully treated water to the City of East Lansing and adjoining Meridian Township. A water treatment plant was put in operation in 1973 which provides 15 mgd of water containing 85 mg/liter or less of hardness and no iron. The plant incorporates an in-house lime handling system to transfer the pebble lime from large storage bins to day bins positioned over the lime feeders. Pretreatment is provided in two primary clarifiers and two secondary clarifiers. Mixing, flocculation and sedimentation are performed in one tank. Wood plank deck and laminate wood beams were chosen to cover the pretreatment tanks because of the lower capital cost than that of a concrete roof and the lack of future maintenance requirements. A concrete roof would have cost more and required periodic painting. After pre-treatment, the water is applied to dual media (sand covered by anthracite) gravity sand filters for removal of chemical floc. Lime soda softening of the water results in two waste by-products: the backwash water is stored in an earthen pond and recycled to the inlet of the plant; the line sludge is stored a lagoon system where the solids settle out and the clear supernatant left is collected and pumped back to the plant. The plant functions with semi-automatic controls. Sixteen new wells, more than 9 miles of pipe to transport the water to the plant and 2 miles of distribution mains were developed in conjunction with the water treatment plant. (Orr-FIRL)

**HOW SILICA AFFECTS IRON REMOVAL FROM GROUNDWATER,**
Yule, Jordan and Associates, Camp Hill, Pa. Environmental Engineering Div.
L. R. Robinson, Jr.
Water and Sewage Works, Vol 122, No 3, p 74-77, March, 1975. 9 tab, 18 ref.

Descriptors: *Groundwater, *Water treatment, Iron, *Oxidation, *Silica, Hydrogen ion concentration, Alkalinity, Pilot plants, Laboratory tests, *Waste water treatment.
Identifiers: *Iron removal.

Interference with iron oxidation and removal is frequently attributed to low pH and low alkalinity concentrations. It has also been indicated that high concentrations of silica can catalyze ferrous iron oxidation and retard hydrolysis of ferric iron and thus hinder sedimentation and filtration. The results of both jar tests and pilot plant studies indicate that silica interference with iron removal is apparently the reaction of silica in alkalinity determinations to indicate sufficiently high bicarbonate alkalinity to insure rapid ferrous iron oxidation. When lime or soda ash were added, satisfactory iron oxidation and removal was achieved. These results confirm the hypothesis that a bicarbonate alkalinity of at least 100 mg/liter as CaCO3 is necessary to obtain immediate oxidation and subsequent removal or iron from groundwater. Tests were performed on several groundwater supplies in East Pakistan where poor iron removal was obtained even though alkalinities were found to be in excess of 100 mg/liter. Silica was observed in significant concentration in several of the waters studied. Where treatability was unsatisfactory, the addition of lime or soda ash was successful in causing the oxidation of the iron. The addition of silica in the form of sodium metasilicate had no effect on the treatability of the water. (Orr-FIRL)

**CORROSION BY DOMESTIC WATERS,**
Illinois State Water Survey, Urbana.
T. E. Larson.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-244 723, $4.25 in paper copy, $2.25 in microfiche. Bulletin 59, 1975. 48 p, 32 fig, 2 tab, 38 ref, 3 append.

Descriptors: *Corrosion, *Corrosion control, *Domestic water, Pitting(Corrosion), Pumps, Water wells, Materials, Laboratory tests, Water quality, Water chemistry, Metals, Flow rates, Pipes, Distribution systems, *Water treatment, Chemical reactions, Scaling, Dissolved oxygen, Hydrogen ion concentration, Laminar flow, Turbulent flow.
Identifiers: Tuberculation, Cold water, Hot water, Carrying capacity loss, Calcium carbonate saturation index.

Essential data on corrosion by domestic waters gathered by the Illinois State Water Survey in isolated or programmed studies, and from experience at state institutions since 1950, were summarized. Domestic water was defined as any water provided for human consumption and allied uses, in contrast to sea water, brines, or conventional sewage effluents. Corrosion was defined as the destruction of a metal usually by chemical or electrochemical reaction with its environment. A brief review of basic fundamentals of corrosion was presented as background for the summaries of corrosion data. Also included were some of the general and specific recommendations concerning inhibitors and construction materials that were developed through laboratory and field evaluations for use by architects, engineers, and institutional maintenance personnel. Research needs were indicated. Appendixes contain: (1) a discussion of corrosion in water wells and pumps; (2) a description of the dynamic nature of distribution systems and the problems that can exist; and (3) documentation of actual changes in water quality resulting from microbiological growths to the point of removal of all oxygen, and then further change under anaerobic conditions in a 6500-foot isolated water line at the end of the system. **SYSTEM FOR SOFTENING AND DEALKALIZING WATER BY ELECTRODIALYSIS,**
Vast (J.) Associates, Inc., New York. (assignee)
A. R. Tejeda.
U.S. Patent No 3,893,901, 12 p, 8 fig, 6 ref; Official Gazette of the United States Patent Office, Vol 936, No 2, p 653, July 8, 1975.

Descriptors: *Patents, *Water treatment, *Water quality control, *Water softening, *Alkali water, *Electrodialysis, Electrodes, Permselective membranes, Anion exchange, Cation exchange, Separation techniques.
Identifiers: *Dealkalization.

The object is to provide an electrodialytic system which by suitable adjustment of the types of exchange material and permselective membrane employed is capable of either softening or dealkalizing water at a low power consumption and high efficiency. For softening, the water is passed through a cation exchange material placed between a pair of cation permselective membranes. For dealkalizing, the water is passed through an anion exchange material placed between a pair of anion permselective membranes. The ion exchange permselective membranes are like types having ion exchange material of the same type located between them form a chamber in an electrodialytic cell with electrodes at opposite ends of the cell to which a source of direct current is applied. **WATER TREATMENT FOR PUBLIC SUPPLY,**
M. A. Hilson.
Chemistry and Industry, Vol 1, p 21-25, January 4, 1975. 1 tab, 2 ref.

Descriptors: *Water treatment, *Potable water, *Water quality control, Water distribution(Applied), Flocculation, Coagulation, Filtration, Sedimentation.

Various Acts of Parliament have put the burden on the supplier of supplying water that 'is free from visible suspended matter, color, odor and taste, and from all objectionable bacteria indicative of the presence of disease producing organisms and contains no dissolved matter of mineral or organic origin which in quality or quantity would render it dangerous to health, and will not dissolve substances from the distribution system which are injurious to health.' Water treatment to obtain such a water falls into 3 stages: bacteriological sterilization; chemical purification to remove objectionable matter; and, quality adjustment to ensure that the water does not pick up any harmful substances during distribution. The processes available to achieve the various stages are presented with emphasis on the processes used by the Fylde Water Board, Great Britain. Chlorine, chlorine dioxide, ozone, or ultraviolet radiation may be used for the sterilization of water. Chemical clarification consists of two stages: flocculation and separation of the solid material formed from the bulk of the water. The first step is achieved by the addition of a controlled dose of a coagulant. The floc formed during coagulation can be made tougher and denser by the addition of polymeric compounds. The removal of the solids from the water can be carried out either in a single stage process by direct filtration or by a two stage process of sedimentation followed by filtration. Water softening can be accomplished by precipitation or by ion exchange. Final quality adjustment is the adjustment of the pH value to a level at which the water will not corrode the pipelines or deposit calcium carbonate in the system. (Orr-FIRL)

**CAN A COMPUTER REALLY OPERATE A WATER-FILTRATION PLANT,**
Kennedy Engineers, Inc., Tacoma, Wash.
J. Watkins, Jr.
Journal of the American Water Works Association, Vol 67, No 7, p 351-352, July 1975.

Descriptors: *Water treatment, *Filtration, *Treatment facilities, *Operations, *Control, *Computers, Water quality, Flow, Measurement, Monitoring, Simulation analysis, Computer programs, Hydraulics, Industries, Mathematical models, Systems analysis, Chemicals, Evaluation.
Identifiers: Process control, Real-time, Prediction.

In view of today's technology, the ability of the computer to independently perform process control functions on a real-time basis in the operation of a filtration plant is evaluated. To control any function, one must predict the response of the function. Given are the specifications for a mathematical system model to predict, monitor, and control the variables of the process. The Santa Clara District's Rinconada treatment plant is utilized to illustrate a typical filtration plant using a full treatment process (chemicals, coagulation, sedimentation, filtration, and chlorination). In such a plant, control of two processes is necessary: the hydraulic flow of water through the plant and the treatment process itself. The first can be readily calculated and simulated. Two problems, however, make it extremely difficult to develop mathematical control models for the treatment process: (1) water treatment is still partially an art and not completely a science; and (2) There is a lack of good primary instrumentation to measure and control process variables so as to perform control functions on a real-time basis. In conclusion, further development of mathematical equations of the chemical and physical process, process techniques, and equipment and instrumentation are needed before the computer can independently exercise these control functions. Those functions which a computer can perform beneficially in a treatment plant operation, based on Santa Clara experience, are given, and recommendations are made that include enlisting aid of a control systems engineer and selecting an appropriate computer. **ELECTROLYTIC CONTROL OF ALGAE,**
Calcutta Metropolitan Development Authority (India).
S. K. Paul, K. V. Chari, and B. Bhattacharyya.
Journal of the American Water Works Association, Vol 67, No 3, p 140-141, 1975. 8 fig, 1 tab.

Descriptors: *Algal control, *Chlorophyta, *Electrolysis, *Water treatment, Electrodes, Settling velocity, Electric currents, Water pollution control.

Algae in water fed to water treatment plants and recirculated effluent from stabilization ponds can be controlled by electrolytic treatment. Experiments were conducted on cultures of planktonic algae (Chlorophyta). Individual organisms were mounted on microscope slides, the current passed momentarily, and the treated cells examined to determine damage and if they were dead. Stained dead organisms did not plasmolyze. Also algae-laden water was passed through a gap between two steel electrodes to avoid toxic effects of copper ions in solution. Maximum voltage was 200 volts, water temperature 26-42C, and the minimum gap between the electrodes was selected to avoid clogging by filamentous organisms. When treated water samples were exposed to diffuse sunlight, photosynthesis was weak or absent, and the green color bleached slowly. Dead algae settled quickly and regrowth did not occur. The lethal action of the electric current may be the result of electrical stress on the organisms, which depends on the potential difference across the cells, maintained by the voltage gradient between electrodes; and diffusion of cellular anions and cations. Both effects are instantaneous and independent of rate of flow between electrodes and concentration of organisms. Current density and voltage are important factors. (Buchanan-Davidson--Wisconsin)

## 5G. Water Quality Control

**THE RESPONSIBILITY OF U.S. WATER SUPPLIERS,**
Senate, Washington, D.C.
E. M. Kennedy.
American Water Works Association Journal, Vol 66, No 10, p 559-562, October 1974.

Descriptors: *Water supply development, *Water quality control, *Water quality standards, Water resources development, Political aspects, Social aspects, Social values, Water pollution, Community development, Governmental interrelations, Legal aspects, Planning, Water reuse, Water demand.
Identifiers: *Water Resources Development Act, *Safe Drinking Water Act.

The problem of providing an adequate supply of water while maintaining and improving the quality of water is discussed. The problem is exacerbated by the increasing demand for water and the public's conception of water as a free and inexhaustible resource. The rising level of pollution in water and the growth of population and industry add new threats to the quality of clean drinking water. The key to the solution is a national water policy implemented under the auspices of federal, state and local governments. The solution will have to be multifold and should include a national commitment to assure an adequate supply of water as is in the Water Resources Development Act. A commitment to end massive pollution and a commitment to support a national policy of conservation are recommended also. (Altuve-Florida)

The need for federal standards is emphasized, since many of the water systems in this country do not adequately protect their patrons. This is particularly true of the smaller systems which all will have difficulties in meeting water standards. Although there is no drinking water crisis today, there are symptoms of neglect. The passage of the Safe Drinking Water Bill would reduce this neglect because it would require the establishment of national drinking water standards or regulations and would provide federal financial support for the program. The Act is correct in allowing for primarily local or state enforcement and for federal enforcement only if the local government fails to do so. The portion of the Act which calls for public notification concerning environmental matters is significant because a well-informed public is necessary for the maintenance and improvement of quality water systems. **THE IMPACT OF THE SAFE DRINKING WATER ACT ON UTILITIES,**
Boston Metropolitan District Committee, Mass.
J. W. Sears.
American Water Works Association Journal, Vol 66, No 10, p 573-574, October 1974.

Descriptors: *Utilities, *Water quality control, *Water quality standards, *Potable water, *Environmental sanitation, Cost-benefit analysis, Consitiutional law, Administration, Penalties(Legal), Legal aspects, Administrative decisions, Discount rates, Pricing, Water rates, Value, Federal government.
Identifiers: *Safe Drinking Water Act, Liability(Legal aspects).

The Safe Drinking Water Act is a progressive and reasonable piece of social legislation but there are several potentially troublesome aspects of the act. These include the potential cost for compliance, especially the cost to small systems. The application provisions fail to adequately define what systems are controlled by the act and as a result many systems may not be affected by the act although they are the types of systems that the statutory draftsmen of the act probably envisioned. The possibility of erroneously imposed criminal and civil penalties on administrators who are actually not in a position of control is discussed. Water supply administrators should attempt to create a constituency of citizens who understand and follow their efforts. Pricing rates should be reevaluated and nationwide quantity discounts should be eliminated. (Altuve-Florida)

The Federal Water Pollution Control Amendments of 1972 (Public Law 92-500) were analyzed to test the assumption that a resource well described and well monitored will be well managed. A model was designed of resource legislation which focused attention on: (1) who is being addressed by the law, (2) what actions are to be taken under the law, and (3) what are the defined relationships between actors and objects of action. A content analysis was performed on the 80 sections of the law. In addition, the Wisconsin Pollutant Discharge Permit System was examined. The 1972 Water Pollution Control Act was found primarily to establish an information, monitoring and standards program creating a large data system about water resources and water quality. Of the 80 sections in the law, 75 of them pertained primarily to how the law is to be administered, enforced and reported, not how the water is to be used. This analysis was performed in the context of previous criticism that the regulatory/enforcement procedure will not solve water pollution problems. The study found that an elaborate information system is resulting from the regulatory/enforcement model, but based on the criticism of the model, the vast information system is not to be expected to significantly affect effluent discharges. Several changes are suggested which emphasize technical assistance to the user and information feedback to the pollution dischargers as ways to improve and modify the legislation.

Identifiers: *Rhodesia, Chemical treatment, La application.

Overall water pollution problems in Salisbu Rhodesia, are presented, as well as proposals the future. Between 1950 and 1973, there has b a large increase in population, water consumpti and sewage flow, which has strained both financ and natural resources. The region is on watershed within the catchment area of its wa supply, consisting of the Hunyani River and th tributaries and Lake McIlwaine. It was determi that treated sewage effluents are the major ca of pollution. The regional Council decided that municipality should be responsible for collecti treatment, and disposal of all Salisbury sewage; treatment will be concentrated at works with the largest gravity drainage, clos agricultural land; outfall sewers will be structed draining to the new treatment facili schemes for irrigation of land with sewage fluents will be developed; and contin hydrobiological research will be conducted well as studies on chemical treatment of sewag combination of biological and chemical treat and irrigation were formulated such that: d the dry season, all flow will be treated biologic with effluent being applied to land; and, durin wet season, flow will be treated biologically the amount to be irrigated or stored. with e flows to be treated chemically as raw sewage, treated effluents being discharged to the (Prague-FIRL)

onmental Emergency Branch of En-
Canada was formed to cope with en-
l emergencies. To deal effectively with
ntal emergencies, the following items
considered: analysis of the threat;
ss; and, evaluation of the risk. The
paredness is dependent on: the contin-
which assigns the responsibilities and
necessary to reduce the damages due to
cy; the training of the personnel; and,
ility of proper equipment, techniques
and materials. Most of the materials, techniques and equipment currently used are unsatisfactory in terms of their application, labor requirements, sophistication, and/or effectiveness. Research and development requirements in the following areas are representative of the lack of scientific knowledge: diking of storage facilities; detection of spills; containment of spills; recovery of oil and other hazardous materials; and, cleaning and restoration of beaches contaminated with oil. The examples given deal with oil spills but are applicable for other types of environmentally hazardous materials. Guidelines are given for assessing every project for the evaluation and development of new technology. (Orr-FIRL)

**WATER RESOURCES,**
British Columbia Water Resources Service, Vancouver.
B. E. Marr.
In: Proceedings of the Annual Conference of the British Columbia Water and Waste Association, April 9-11, 1974, Vancouver, British Columbia, p 1-10.

Descriptors: *Planning, *Administration, *Water pollution control, Waste water treatment, Legislation, Water resources, *Canada.
Identifiers: *British Columbia.

The functions and responsibilities of the British Columbia Water Resources Service include water licensing, water investigations (engineering and planning), pollution control, and environmental matters. The pollution control and environmental activities of the Water Resources Service are discussed. A series of public inquiries into each of the major categories of waste discharge in B. C. were held beginning in 1970. Three levels of objectives have been established for most classes of discharge. These objectives will be upgraded or amended to incorporate and reflect changes in technology, economic conditions, and public attitudes. B. C. has developed a discharge permit system. The last five years have seen a good inventory of discharges compiled, objectives set for most types of discharges, and identification of environmental, technical, and administrative problems. A need exists for flexibility in planning--regional, site, resource development, and waste management planning. The structure within the Water Resources Service is being integrated and decentralized. Investigations are being performed to increase the department's expertise in environmental sciences. Waste treatment plant operator training programs are being initiated. (Orr-FIRL)

**MILESTONE WATER LEGISLATION ACCOMPANIED BY MILLSTONE OF BUREAUCRATIC RED TAPE,**
Hampton Roads Sanitary District, Norfolk, Va.
W. A. Cox.
Professional Engineer, Vol 44, No 10, p 21-23, October 1974.

Descriptors: *Water quality, Planning, *Legislation, *Federal jurisdiction, Effluents, Water pollution control, Treatment facilities, Regulations, Waste water treatment, Participating funds, Costs.
Identifiers: *Public law 92-500.

Since the passing of Public Law 92-500, water quality planning has been improved. However, the processes and steps required to activate a new major waste treatment facility are time-consuming and costly. Uniform effluent limitations to meet 1977 and 1983 treatment method deadlines impose a great deal of pressure on municipalities, especially on their consulting engineers. Applications for funding are processed slowly at the Federal level; Congress has also impounded many of the existing funds. It was recommended that modifications be made either in the law or in the implementation of regulations to ease some of the burden. These include: modification of the time frame constraints; release of impounded funds to stimulate new jobs and manufacturing; reduction of the Federal percentage of participation in funding water pollution control projects; streamlining of the fund distribution process; and, the reinstatement of provisions for reimbursement to municipalities. In addition, it was suggested that more responsibility be delegated to the states, that fund allocation to the states be resumed on a population basis, and that the requirements for user charges be amended to allow localities and regional agencies to employ the types of financial procedures used under state laws and municipal ordinances. Finally, one should establish a continuing review of required treatment standards so that they remain flexible to consider demands of the nation's critical energy supply, operating and capital costs, and effects of treatment on receiving waters. **COST EVALUATION OF WATERCOURSE MANAGEMENT IN ESSEX,**
Cambridge Univ. (England). Dept. of Applied Biology.
M. P. Brooker, and J. H. Baird.
Surveyor Public Authority Technology, No. 4288, p 34-37, August 16, 1974. 2 fig, 2 tab, 2 ref.

Descriptors: *Watercourses(Legal aspects), *Drainage systems, *Herbicides, Environmental effects, *Costs, Odor, Taste, Potable water, Water supply, Public health, Agriculture, Chem control.

In England Wales about 3 million acres of agricultural land are entirely dependent on drainage systems of dykes and larger channels and an additional 2 million acres on wet ditches. The maintenance of good drainage by keeping the watercourses free of vegetation is of national importance. In the past, clearing of the channels has been by 'brushing' or cutting and subsequently removing vegetation from the channel by hand. However, chemical control such as the use of herbicides is becoming a more desired solution to this problem. Detailed records have been kept which allow a direct comparison of the unit costs of chemical applications and conventional hand clearance; the unit cost per annum of herbicide treatment is about 50-75% of the conventional hand clearance, raking and disposal. Other factors than cost are involved in the choice of whether to use chemical control. The most important are the implications of using water containing herbicides for potable and agricultural purposes and the ecological effects of their use. The dosages used in chemical control are unlikely to produce acute toxic effects in man or livestock. One problem involved with using herbicide containing water for public water supply is the presence of tastes and odors. If recommendations for use are followed correctly, herbicides such as 2,4-D and dalapon are unlikely to affect crops irrigated with treated drainage water. The ecological effects on birds by destroying their nesting places and the change in the benthic invertebrates which may in turn cause in fish populations and the effects of chronic doses of herbicides on human and farmstock populations must be evaluated before widespread use of chemical control for watercourse management can be instituted. **COST SHARING TO HELP CLEAN OUR WATERWAYS.**
Dimensions NBS, Vol 58, No 12, p 267-269, December, 1974.

Descriptors: *Costs, *Federal Water Pollution Control Act, *Economics, *Cost sharing, Waste water treatment, Federal government, Municipal water, Industrial water, Treatment facilities.
Identifiers: National Bureau of Standards, Construction Grant Program.

The National Bureau of Standards (NBS) was asked to evaluate the Construction Grant Program by the Environmental Protection Agency, a federal cost-sharing program as defined after the Federal Water Pollution Control Act Amendments of 1972. It was decided by two NBS economists that the cost-sharing is not as efficient or as equitable as it could be. Because the Construction Grant Program provides different levels of Federal funding for different techniques and costs, municipalities may be encouraged to build oversized or inappropriate facilities. The Federal Government subsidizes 75% of the capital costs and cost of land that is needed for the treatment process but does not cover operation or maintenance. Any technology which requires a large operation and maintenance rather than capital costs expenditure will receive little Federal assistance. Distribution of benefits is discussed. Without effective regional cost-sharing management, it may be difficult to apportion costs appropriately between the regional and the federal sectors. Current user fees imposed on industry, households, and businesses for sewage removal and treatment contribute to inefficiency in the selection of techniques and the size of newly developed facilities. The existing program also results in a larger Federal subsidy to industrialized communities than to residential communities. It was suggested, that with optimal cost-sharing, municipalities should choose a scale of abatement that is locally and nationally efficient, and then pay a cost share equal to their marginal benefits. Identifiers: *Steelon-Net veils, Hydro-Engineering installations, *Dreissena polymorpha.

Serviceability of the veils used for safeguarding hydro-engineering installations against Dreissena polymorpha invastion has been studied. Mass settling down of young individuals of this mussel species has been observed on the veil hung in the headrace channel furnishing water to the hydro-engineering installation. The veil of 26 m2/in surface was able to withhold 5 million young mussels. The large-scale of the settling of D. polymorpha on the veil allows for the possibility that a range of veils could protect the hydro-engineering installations effectively against the harmful mussels. Washington Univ., Seattle. School of Law.
R. W. Johnson.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-244 730, $3.75 in paper copy, $2.25 in microfiche. Completion Report, June 20, 1975. 35 p. OWRT A-076-WASH(1).

Descriptors: *Colorado River basin, Legal aspects, *Institutional constraints, Salinity, Irrigation, Coordination, Management, Water law, Water rights, *Optimum development plans, Federal-State water rights conflicts.
Identifiers: *Salinity control.

This study examines the Colorado River basin salinity management program. The optimal solution will generally be found by considering the problem on a basinwide basis. In most cases the optimal solution is one that would result in the least total cost per unit for the largest salinity reduction. This optimal solution requires extensive voluntary cooperation among all water users; it has proven quite effective in the Colorado River basin. The recommendations for a comprehensive basinwide or regional management entity to plan and implement a salinity control program for the Colorado Basin have, to date, produced a voluntary, cooperative interstate discussion group, the 'Colorado River Basin Salinity Control Forum.' To date all irrigation efficiency and water use management programs have been voluntary and are based on education and persuation rather than on legal regulation. Most water managers and other experts in the Colorado Basin believe the voluntary program will, in the long run, be more effective.

Amoco Production Co., Tulsa, Okla. (assignee)
L. W. Jones.
U.S. Patent No. 3,893,925, 4 p, 4 fig, 9 ref; Official Gazette of the United States Patent Office, Vol 936, No 2, p 660-661, July 8, 1975.

Descriptors: *Patents, *Water pollution treatment, *Water quality control, *Separation techniques, *Oil pollution, Oily water, Sulfur, Coalescence, Pollution abatement, Oil wastes.

A system is described for removing dispersed oil from water by contacting the oily water with sulfur to cause the oil to coalesce or agglomerate. A bed of granular sulfur is provided in a vertical tank through which oily water flows downward. An inverted cone shaped member supports the sulfur. This cone shaped member is perforated to permit the passage of fluid but is also provided with protected channels extending from the base of the cone to an oil gathering chamber at its apex. Oil free water is drawn off at the bottom of the vessel. The oil accumulates in the protected channels and being lighter than water rises to the peak or apex of the cone and is drawn off. The water being heavier than the oil has no tendency to rise but falls downwardly to the bottom of the vessel where it is removed. Both coalescence of the oil droplets and separation of the oil from the water is thus accomplished in a single vessel. (Sinha-OEIS)

**COMPARISON OF UREDO EICHHORNIAE, THE WATERHYACINTH RUST, AND UROMYCES PONTEDERIAE,**
Florida Univ., Gainesville. Dept. of Plant Pathology.
R. Charudattan, and K. E. Conway.
Mycologia, Vol 67, No 3, p 653-657, May-June 1975 9 fig, 1 tab, 8 ref. OWRT A-027-FLA(6), 14-31-0001-5009.

Descriptors: *Plant pathology, Aquatic plants, *Aquatic weed control, *Biocontrol, *Florida, *Water hyacinth, *Rusts, *Plant diseases, Water pollution control.
Identifiers: Uredo eichorniae, Uromyces pontederiae, Pickerelweed rust.

The waterhyacinth, Eichhornia crassipes (Mart.) Solms (Pontederiaceae), is a troublesome aquatic weed in the tropics and subtropics. In Florida, Several control methods have been tried against it including control with plant pathogens. Among potentially useful pathogens is Uredo eichhorniae Fragoso and Ciferri which may be specific to waterhyacinth. This rust has not been recorded since its original description in 1927, but as a result of surveys in the past 4 yr it was found in the Entre Rios province of Argentina. There have been doubts concerning the propriety of the generic name of this rust. The similarity of Uredo eighhorniae to Uromyces pontederiae Gerard on the related genus Pontederia (pickerelweed) has been suggested. Uromyces pontederiae has been reported from Urguay in its uredial stage on Eichhornia azurea (Swarts) Kunth, the anchored waterhyacinth. It is uncertain if teliospores are produced on this plant. In surveys in Argentina, the Dominican Republic, Puerto Rico, Uruguay and Venezuela, no rust was seen on E. azurea. The occurrence of Uredo eichhorniae on E. crassipes in Argentina is reconfirmed, and it is compared with Uromyces pontederiae from localities in Argentina, Uruguay and Florida. The pickerelweed rust was collected from Pontederia cordata L. and P. lanceolata Nutt. Some consider the two as extreme types of P. cordata. (Morgan-Florida)

Identifiers: *Waste load allocations, *Verdigris River basin(Okla).

The first and most important step in regional water quality management is river basin planning. One of the most effective methods of water pollution control is treatment of wastes before discharge. Although planners have other alternatives, this method is easily implemented and convenient to administer. In order to maintain a required level of quality in stream waters, waste load alloc

de to individual waste dischargers on the
f the assimilative capacities of the streams
river basin. Stream waters have been
d in the past by large complex simulation
requiring a large amount of input data.
lanners need is a model that is regional in
can work with inadequate data, and
a minimum of man and computer time.
model has been developed and is used to
the quality of stream water in the Ver-
iver basin. A linear programming model
n developed to make the optimal waste
cation, thereby minimizing the total cost
treatment to a region. (Dean-FIRL)

hown in recent years that current pol-
l practices will not be adequate for
rotection of public supplies drawn
l rivers. This reason has prompted the
er Authority to institute a program for
nt and control of the extent and na-

ture of continuous contamination of lowland water sources with persistent chemicals. Some of the considerations which have led to this conclusion and new approach include: a recent 3 year dry period which resulted in very high increases in the concentration of residual pollutants, especially nitrates, in river water; the discovery of benthal biomethylation of mercury and bioconcentration and biotranslocation of chemical residues; and, the finding of the transfer of minute herbicide residues from rivers into public water supplies. Basically, the new pollution control approach would put the current system into new overall arrangements to determine, in detail and with all possible accuracy, what chemical contaminants are, or may be, passed into lowland water supply rivers, whether these are likely to present any health hazard in public supplies abstracted from the rivers, and to seek removal or reduction to acceptable levels of all contaminants which are, or are likely to be, dangerous. The new approach can be described as 'catchment quality control'. (Orr-FIRL)

Identifiers: Central processing units, Input-output matrices, Environmental impact.

The Louisiana Environmental Management System (LEMS) is a data processing program developed to aid the Louisiana Joint Legislative Committee on Environmental Quality in decisions leading to resources legislation. Serving as a central data collection and retrieval point for various agencies, the LEMS will maintain assembled information on the location of monitoring stations and coordinate the files of user agencies with data on: land use, air and water quality; meteorological, climatological, and hydrological phenomena; vegetation; fish and wildlife conservation; population; and economics. This data is geographically stored in relation to the state plane coordinate system. For decision making, all pertinent hydrologic, topographic, engineering, cadastral, and other information from separate sources can be automatically mapped as a combined overlay to one of three chosen scales. Land-use patterns are the input data for interative analyses of present conditions and simulated future human activities for assessing the environmental impact of proposed multiple-purpose water resource developments. The assessment methodology requires two complementary functions. The first, general data assessment, determines pertinent data and their parameters, programs the data as input-output matrices, and uses the matrices with algorithms to analyze conditions at a particular site. The second, simulation modeling, provides real and predicted data to assess specific problem areas; hydrodynamic and diffusion simulation programs are included. To demonstrate LEMS, an environmental assessment study in the Tenasas River basin (Louisiana) is considered in terms of its multiple-purpose features. Finally, objectives of the Lower Mississippi River Basin Water Quality Management Plan are considered. (Bell-Cornell)

**SIMULATION OF WATER QUALITY MANAGEMENT POLICIES,**
Virginia State Water Control Board, Richmond.
J. W. Hyden, J. A. Chisman, and H. H. Macaulay.
Journal of the Environmental Engineering Division, Proceedings of ASCE, Vol 101, No EE4, Paper No 11524, p 623-641, August 1975. 5 fig, 4 tab, 4 equ, 12 ref.

Descriptors: *Water quality control, *Management, *Environmental engineering, *Simulation analysis, Standards, Effluents, River basins, Optimization, Water policy, Economic efficiency, Costs, Waste water treatment, Dissolved oxygen, Systems analysis, Mathematical models, Equations.
Identifiers: *Effluent fees, Feedback, Cost minimization.

A series of water users are located along a river which is the sole source of water intake and the only place in which to discharge wastewater. For a given set of conditions, a management policy such as effluent standard or charge can be set which reflects the basin-wide economic optimum. As these conditions change with time, however, a previously established policy may give rise to a misallocation of allowable waste discharge levels, resulting in a current actual treatment cost greater than that determined to be optimal under the new conditions. Using the prototype computer simulation program written for this study, the actual and optimal solutions are compared. Simulation runs involving three dynamic conditions--user growth, new users, and variable stream-flow--have been made. Misallocations are noted in actual performance relative to optimal solutions. Under an effluent charge policy, resulting treatment cost surpluses and deficits are partially offset by charge deficits and surpluses, respectively. Under a standards policy, there are no charges to offset misallocations. The general simulation program developed for the study has the following capabilities: (1) development of continuous polynomical cost functions based on actual cost data; (2) determination of the optimal solution using the procedure of the Wilde-Beightler algorithm for a nonlinear objective function subject to linear constraints; and (3) comparison of the optimal solution to the actual response, by user acting under a previously established quality management policy. (Bell-Cornell)

**OPERATION CLEAN SWEEP,**
Army Engineer District, Jacksonville, Fla.
C. F. Zeiger, J. T. McGehee, and J. F. Willis.
In: Proceedings, Research Planning Conference on Integrated Systems of Aquatic Plant Control, October 29-30, 1973, Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, p 5-13, August 1974. 11 fig.

Descriptors: *Water hyacinth, *Aquatic weed control, *Herbicides, 2-4-D, Environmental effects, Spraying, *Florida, Costs, Water pollution control.
Identifiers: St. Johns River(Fla), Lake George(Fla).

An effort was made to catch and spray the water hyacinths in the St. Johns River from Palatka to Jacksonville, Florida in their early growth stage, since they had been damaged by frost, and to bring the number of plants to manageable proportions before the heavy summar growing season. The long range objective was to reduce the water hyacinth problem to a routine maintenance proportion. A residual shoreline fringe had been left in 1971, but during the mild winter of 1972 the plants flourished. Spraying controlled the Lake George area but large free-floating mats had moved downstream, shifting with the wind, blocking navigation, damaging crab traps, endangering piers, and reducing the amount of dissolved oxygen in the water by the heavy concentrations of the floating plants. During the spring of 1973, the control program had reduced the water hyacinth problem to a routine maintenance situation which required only one airboat to cover the area. The intensified control operation required 50 days to spray 3026 acres with 2,4-D amine at an estimated cost of $37,000 or $12.23 per acre. Despite the concentrated spraying there was a heavy population of young bass, possibly due to the cool weather and the vegetation. (See also W75-08289) (Buchanan-Davidson--Wisconsin)

**FIELD TESTS OF SLOW-RELEASE HERBICIDES,**
Army Engineer District, New Orleans, La.
W. E. Thompson.
In: Proceedings, Research Planning Conference on Integrated Systems of Aquatic Plant Control, October 29-30, 1973, Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, p 15-20, August 1974. 6 fig.

Descriptors: *Aquatic weed control, *2-4-D, *Herbicides, *Application methods, *Louisiana, Rubber, Floating plants, Water hyacinth, Submerged plants, Rates of application, Water pollution control.
Identifiers: Slow-release formulations, Water milfoil, New Orleans(La).

Slow-release formulations of the butoxyethanol ester of 2,4-dichlorophenoxyacetic acid (2,4-D) dissolved in natural rubber were developed to treat aquatic vegetation only in specific zones, such as at the water surface or rooted plants at or near the mud-line, eliminating the need for total water column treatment and reducing the amount of chemical applied, frequency of application, and total cost. Three tests were made in the New Orleans area. In a field test of a rubber-herbicide combination with a specific gravity greater than one, surface air bubbles prevented the particles from sinking rapidly enough, causing part of the root to be undertreated and the rest overtreated. This herbicide was not very effective against Brazilian elodia, hornwart or fanwart and even an effective herbicide would not have reached toxic concentrations under the test conditions. Rubber-herbicide suspender strips satisfactorily controlled water hyacinths. Plant bending occurred for a longer time than with foliar treatment but the plants were eliminated in about seven months, and the ditch remained clear of hyacinths. Rubber-herbicide sinkers applied to Eurasian water milfoil sank when broadcast but were light enough to remain on the plant leaves. Discoloration of the plants was observed in two weeks and vegetation was eliminated in four months. (See also W75-08289) (Buchanan-Davidson--Wisconsin)

**AQUATIC PLANT CONTROL ON LAKE CORPUS CHRISTI,**
Army Engineer District, Galveston, Tex.
C. J. Novosad.
In: Proceedings, Research Planning Conference on Integrated Systems of Aquatic Plant Control, October 29-30, 1973, Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, p 21-23, August 1974.

Descriptors: *Aquatic weed control, *Herbicides, *Water hyacinth, Alligator weed, *Texas, Application methods, Rates of application, Spraying, Costs, Floating plants, Operating costs, Maintenance costs, Annual benefits, Cost-benefit ratio, *2-4-D.
Identifiers: *Lake Corpus Christi(Tex), 2-4-D BEE.

Since control of water hyacinths in Lake Corpus Christi, Texas was begun in March 1970, about 17,000 acres have been treated. Most spraying operations were from small boats using 2,4-D butoxyethanol ester at a rate of 2 to 4 lbs/acre active acid equivalent. Aerial spraying was also used with increased dosages. Some areas could not be reached by boats or aircraft thus it was necessary to spray using long hoses from boats or land-based trucks. At the date of the report the lake was essentially free of hyacinth infestations and required only a small amount of maintenance spraying to control seedlings. The estimated total first cost for the plant control and eradication program was $724,700 with an estimated annual charge of $24,550 based on 3-1/4% interest rate for amortization and a project life of 100 years. The annual charges totaled $29,050 which included $4,500 for operation and maintenance. The annual benefits for eradication of water hyacinth and alligator weed in ten work areas (Nueces, Guadalupe, Sabine, Trinity, Neches, San Jacinto, and Rio Grande River Basins; Cypress Creek Basin; and north and south coastal areas) were estimated at $194,040. The benefit-cost ratio was 6.7. (See also W75-08289) (Buchanan-Davidson--Wisconsin)

**CRITERIA FOR HERBICIDE EVALUATION,**
Environmental Protection Agency, Washington, D.C. Office of Pesticide Programs.
T. D. Burkhalter.
In: Proceedings, Research Planning Conference on Integrated Systems of Aquatic Plant Control, October 29-30, 1973, Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, p 29-31, August 1974.

Descriptors: *Aquatic weed control, *Specifications, *Regulation, *Legislation, Standards, Herbicides, Pesticides, Water quality standards.
Identifiers: *Pesticide registration.

The Criteria and Evaluation Division of the Pesticide Program of the Environmental Protection Agency is responsible for the development of guidelines for the registration of pesticides. The authority for the regulation of pesticides is found in the Federal Insecticide, Fungicide, and Rodenticide Act, which specifies the administering agency and delegates to that agency the authority to establish regulations to accomplish its provisions. Regulations generally deal with one provision of an Act, presenting policies and procedures necessary to effectively administer that provision. To clarify the requirements of the Act and the penalties for not adhering to them, Congress required that guidelines be published, specifying the kinds of information required to support the registration of a pesticide. Guidelines were prepared to interpret the Act, to detail requirements and suggestions, interrelate information, and answer questions. The guidelines include an appendix of conversion tables and required and suggested methods and procedures. Data will be presented in sections indicating various disciplines in three categories: required, suggested, and tentative. To deal with special problems involved with aquatic pesticide use, Budget Issue Papers are prepared to delineate the problems and recognize the needs for acceptable vocabulary, definitions, testing and evaluation methods. **REGISTRATION OF HERBICIDES FO AQUATIC USE,**
Environmental Protection Agency, Washington D.C. Office of Pesticide Programs.
R. J. Hummel, and J. C. Cummings.
In: Proceedings, Research Planning Conferen on Integrated Systems of Aquatic Plant Contr October 29-30, 1973, Army Engineer Waterwa Experiment Station, Vicksburg, Mississippi, p 36, August 1974.

Descriptors: *Pesticide residues, *Toxicity, Sta dards, *Herbicides, Aquatic weed control, Lo environment, Lentic environment, Estuari Safety, Regulation, Potable water, 2-4-D, Cro 2-4-5-T, *Water quality standards.
Identifiers: *Herbicide registration.

Toxicology data, including 90-day feeding for t species of mammals, and residue data for irriga crops, meat, poultry, milk, eggs, fish, shellfi and potable water are required for registration each aquatic herbicide. Separate protocols probably be necessary for still waters, flow waters, and tidal estuaries because of diverg environmental conditions. If herbicide resid are expected, toxicology data must be furnishe support safety of the residues. Residue clearа for USDA registration can be obtained requesting the USDA to register it as a nonf use or petition for an FDA regulation settir tolerance or exemption from requirement tolerance. A nonfood use involves applica remote from food crops where there is no reas ble expectancy of residues; this may include s aquatic uses. If used for irrigation, residue must support the use; water should be monit downstream and if residues are indicated, analysis should be made to determine res tolerances. A March 1968 Public Health Se bulletin updated drinking water standards t clude 2,4-D, 2,4,5-T, and 2,4,5,-TP and prese guidelines for water control authorities. Le tive jurisdiction for pesticide tolerance in po water was unresolved. (See also W75-0 (Buchanan-Davidson--Wisconsin)

Agricultural Research Service, Fort Laude Fla.
R. D. Blackburn.
In: Proceedings, Research Planning Conf on Integrated Systems of Aquatic Plant C October 29-30, 1973, Army Engineer Wat

eriment Station, Vicksburg, Mississippi, p 43-August 1974. 3 tab, 11 ref.

criptors: *Submerged plants, *Herbicides, uatic weed control, *Chemcontrol, Diquat, 2-chlobenil, Copper, Application methods, Tox-, Fish, Rates of application, Taxonomy.
tifiers: *Egeria densa, Brazilian elodea, En-all.

taxonomic features of Egeria densa are ribed. The effects of several commonly used icides on Egeria were studied. In the laborato-ndothall (amine salt) was more effective than ssium and dihydroxy aluminum salts. Addi-of copper to endothall increased the effective-of both herbicides. Diquat alone or with a er amine complex was very effective. Water erature during application may be important. at gave good control in growth pools. Addi-of endothall or copper to diquat had no ad-ge. Endothall (amine salt) was effective on a but toxic to fish. Endothall (potassium and troxy aluminum salts) were safe for fish but ot control Egeria. Copper plus endothall in-ed the effectiveness of both. Copper partially olled Egeria, was toxic to fish, and regrowth apid. In field trials, diquat partially controlled a; the diquat-copper complex gave excellent ol; but potassium endothall plus diquat did ncrease activity. Endothall (amine salt) was ost effective and endothall (TD-1874) more ive than the aluminum and potassium salts. ndothall controlled-release formulation was effective on Egeria and less toxic to fish than r formulations. Dichlobenil did not control a but delayed regrowth when applied after . (See also W75-08289) (Buchanan-David-Visconsin)

iers: Egeria densa, Brazilian elodea, Black -a), Lake Martin(La), K-lox, Fenac, 3M E, TD-1874, TD-1929, SD-16389, Com-K, Triazine, Florida elodea, Hydrilla ver-.

esting of promising herbicides during previ-sts was conducted in Lake Martin near tte, Louisiana. In one test diquat and diquat tank mix including copper hydroxide olamine complex (K-lox) were most active control of Egeria densa, followed by en-derivatives TD-1874 and TD-1929. K-lox ss protection than when mixed with diquat. gave poor results which were inconsistent or pool and field studies. The 3M System E ation was of no practical value for Egeria . In another test an experimental copper x formulation containing 8% copper ound K) was cost effective against Egeria, d by diquat + K-lox, diquat + compound x, and diquat. Effective control of Egeria tests could thus be achieved with at least erbicides. SD-16389, an experimental , received the lowest rating, which was in-nt with pool studies, perhaps due to dilu-tors. Further testing of SD-16389 will be ed under field conditions to determine if e rates and/or application techniques may loped to provide the control shown in pool new invasion of Hydrilla verticillata in a was discovered on July 1973 in Spanish Lake near New Iberia. **AQUATIC PLANT CONTROL USING HERBICIDES IN A LARGE POTABLE WATER SUPPLY,**
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Fisheries and Wildlife Sciences.
C. B. Schreck, C. R. Berry, R. J. Strange, S. L. Van Horn, and R. V. Corning.
In: Proceedings, Research Planning Conference on Integrated Systems of Aquatic Plant Control, October 29-30, 1973, Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, p 61-70, August 1974. 5 fig.

Descriptors: *Impoundments, *Potable water, *Aquatic weed control, *Herbicides, Diquat, *Virginia, Comparative productivity, Fish, Rates of application, Dispersion, Application methods, Pesticide residues, Bottom sediments, Reservoirs, Oxygen.
Identifiers: *Chickahominy Reservoir(Va), *Walker's Dam Impoundment(Va), Newport News(Va), Coontail, Duckweed, Egeria densa, Brazilian elodea, Potassium endothall, Lyngbya, Ceratophyllum.

In July 1973, flowing water and still water quadrants of Chickahominy Reservoir (Walker's Dam Impoundment) in Virginia, a potable water supply for Newport News, were treated with diquat dibromide and potassium endothall to control Brazilian elodea (Egeria densa). The effects on biological, chemical, and physical parameters of the ecosystem; extent of weed eradication; and herbicide physical and biological behavior were investigated. Rhodamine B indicated limited water movement. Nitrates, nitrites, pH, total phosphates, orthophosphates, calcium, magnesium, hardness and alkalinity did not change, but oxygen concentration increased steadily in weeded areas. Light extinction decreased. Phytoplankton primary productivity was immediately depressed, then increased steadily. Fish were not killed or eliminated. Closing the reservoir to human consumptive uses for 14 days was enough for the chemicals to dissipate. Herbicide concentrations and chemical oxygen demands in Egeria, coontail, duckweed, algae, bluegills, golden shiners, bass, and hydrosoils were being determined and dynamics of uptake and decline in water, plants, and sediment simulated. Visual observations and aerial photographs were made of plant dieoff. Duckweed surface elimination was an index of Egeria eradication. Egeria and coontail declined but algae increased following treatment. The treatment was successful and acute detrimental environmental impacts were not evident. **BIOLOGICAL CONTROL OF ALLIGATOR WEED, 1959-1972,**
Agricultural Research Service, Beltsville, Md.
J. R. Coulson.
In: Proceedings, Research Planning Conference on Integrated Systems of Aquatic Plant Control, October 29-30, 1973, Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, p 71-74, August 1974.

Descriptors: *Aquatic weed control, *Biocontrol, *Alligatorweed, Insects, *South Carolina, Overwintering sites, Reservoirs, Plant populations, Succession.
Identifiers: *Agasicles hygrophila, Columbia(SC), Jim Woodruff Reservoir(SC), Eurasian water milfoil, Giant cutgrass, Hydrilla, Limnophylla.

The biological control of alligatorweed by Agasicles hygrophila was evaluated. Agasicles can overwinter as far north as Columbia, South Carolina and seems to be capable of reducing alligatorweed to a lesser economic or noxious role in the environment. There are insecticides which can control but not eradicate Agasicles; however this will probably never be necessary as its populations will probably vary with the food supply. At the Jim Woodruff Reservoir treatment of alligator weed caused water hyacinths, Eurasian water milfoil, Hydrilla, Limnophylla, catails, and giant cutgrass to increase. Thus a modification in the aquatic ecosystem tended toward increased diversity in the plant community but little improvement in the balance between producer and consumer organisms because of the pest potential of the invading plant species. In an ecosystem with several introduced weeds competing for space but without a complex of natural enemies, control efforts toward one species, if successful, can mean expansion of one or more of the others. A total pest management program for aquatic weeds is needed. Resources currently available for biological control of weeds limit this approach. (See also W75-08289) (Buchanan-Davidson--Wisconsin)

**INTEGRATED CONTROLS ON NOXIOUS AQUATIC PLANTS,**
Texas Parks and Wildlife Dept., San Antonio. Statewide Noxious Vegetation Control Program.
L. V. Guerra.
In: Proceedings, Research Planning Conference on Integrated Systems of Aquatic Plant Control, October 29-30, 1973, Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, p 85-87, August 1974.

Descriptors: *Integrated control methods, *Aquatic weed control, Biocontrol, Insects, Alligatorweed, Overwintering sites, Water hyacinth, 2-4-D, Floating plants, Submerged plants, Chemcontrol, Copper sulfate, Mechanical control, *Texas, Harvesting, Succession, Chara, Application methods, Rates of application.
Identifiers: Eurasian water milfoil, Coontail, Egeria, Elodea, Flea beetles, Water hyacinth weevils, Cabomba, Water lilies, Bladderwort, 2-4-D BEE, Aqua Kleen 20.

The program of integrated control of noxious aquatic plants in Texas involves chemical and biological methods. Mechanical methods proved to be expensive; use of the fiber, protein, and residue as chicken feed was unfeasible; plants grew back in 43 days, and harvested plants were replaced by hardier, more chemically resistant plants. Flea beetles have been used on alligatorweed and water hyacinth weevils on water hyacinths. Establishment of permanent brood stock colonies of these insects near Brownsville and possibly San Marcos are planned. Dramatic results have been obtained with chemicals in Caddo Lake in northeast Texas where the main boat roads were blocked by white and yellow water lilies, milfoil, bladderwort, coontail, cabomba, and elodea. Granulated 2,4-dichlorophenoxy acetic acid butoxyethanol ester (2,4-D BEE) was effective against broad leaf plants, but egeria, chara, and cabomba had a natural partial resistance. Treatment of these plants under phytotoxic stress with copper sulfate gave excellent results. A second application of 2,4-D BEE was necessary in areas subject to flooding, high turbidity, and a flushing effect from high currents; the gradual decomposition of the plants and nutrient release improved fishing. Five watersheds are now under a minimal maintenance program, and work is progressing on others. (See also W75-08289) (Buchanan-Davidson--Wisconsin)

In: Proceedings, Research Planning Conference on Integrated Systems of Aquatic Plant Control, October 29-30, 1973, Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, p 97-102, August 1974. 12 ref.

Descriptors: *Biocontrol, *Aquatic weed control, *Plant diseases, Water hyacinth, Alligatorweed, Southeast United States, Florida, Blights, Rots, Spots, Hosts, Plant pathology, Viruses, Subtropic.
Identifiers: *Rhizoctonia solani, *Sepholosporium zonatum, Eurasian water milfoil, Hydrilla, Phthium, Sclerotium, Penicillium.

The progress of research at the University of Florida in the study of plant diseases for the biological control of noxious aquatic plants, especially water hyacinth, Hydrilla, alligatorweed, and Eurasian water milfoil is described. Because many of these plants are not native to the United States, disease surveys were made in much of southeastern United States, the Caribbean Islands, South and Central America, and India. Several diseases have been found to affect water hyacinth. Of the leafspots, Cephalosporium zonatum has the highest potential. Indian workers believed Alternaria eichhorniae had potential, but Florida isolates were not aggressive pathogens; Indian isolates are being studied. Three general blights have also been studied; Rhizoctonia solani is especially promising despite its wide host range. A severe root and crown rot was discovered which may be caused by a complex of organisms. The five diseases against Hydrilla were the first ever recorded, and their potential is being assessed. A stunt disease of alligatorweed caused by a virus that may belong to the beet-yellows group has been found, but transmission of the causal agent has been difficult. Certain isolates of R. solani will also affect Hydrilla and alligatorweed. No disease for Eurasian water milfoil has yet been isolated. (See also W75-08289) (Buchanan-Davidson--Wisconsin)

Army Engineer Waterways Experiment Station, Vicksburg, Miss.
J. G. Collins.
In: Proceedings, Research Planning Conference on Integrated Systems of Aquatic Plant Control, October 29-30, 1973, Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, p 111-118, August 1974. 7 fig.

Descriptors: *Aquatic weed control, *Irradiation, *Water hyacinth, Radiation, *Louisiana, Water pollution control.
Identifiers: *Laser, *Carbon dioxide laser, Bayou Gauche(La), Lake Concordia(La).

The objective in Bayou Gauche near New Orleans was to determine how the laser system would function in an outdoor environment. There was damage from the irradiation, but no strong correlation between degree of damage and irradiation level. In Lake Concordia, Louisiana, the objective was to establish the effects of carbon dioxide laser radiation on water hyacinths. Biomass decreased with increased irradiation but little additional damage occurred above a level of 30-40 joules/sq cm. Irradiation may have a prolonged effect since the biomass decreased progressively as a function of time following irradiation. During the first two weeks after irradiation there was no effect on propagation rates, but then there was a decrease in propagation rates with an increase in irradiation and time. There was no evidence of actual plant kill. Coverage of plot areas appeared to decrease with an increase in irradiation and time following irradiation. A cost-effectiveness evaluation of the laser as a control device is needed. Tests should be conducted at the beginning and during the height of the growing season on plants with a wider size range using radiation levels below 30 joules/sq cm. Army Engineer Waterways Experiment Station, Vicksburg, Miss.
W. N. Rushing.
In: Proceedings, Research Planning Conference on Integrated Systems of Aquatic Plant Control, October 29-30, 1973, Army Engineer Waterways Experiment Station, Vicksburg, Mississippi, p F3-F24, August 1974. 3 fig, 7 tab.

Descriptors: *Water hyacinth, *Puerto Rice, *Aquatic weed control, *Biocontrol, Growth rates, Snails, Productivity, Biomass, Research and development.
Identifiers: *Brazilian snails, Pomacea australis, Water lettuce.

Water hyacinths are the most troublesome aquatic weed in Puerto Rico. Hyacinth reproduction rate at three different natural sites varied from 0.9 to 8.6 plants per day (48.3 to 587.4 g/day) but the rate of production of daughter plants at all three sites rose to a maximum during a 15 to 40 day period then declined. Sometime within that period, plant material covered the water surface, suggesting that crowding inhibited production of daughter plants. Only water pH varied between plots. Disturbing the plants had some effect on prod tivity, but the extent was not determined. laboratory tests, productivity of plants from three areas varied in tap water, but was the s when fertilized. When hyacinth and Brazi snails (Pomacea australis) were placed in t together, the mass of hyacinths decreased w the mass and number of snails increased. altho their individual weights remained approxima the same. Snails consumed water lettuce fa than hyacinths. When both were present, s consumed the lettuce first, then rapidly consu the hyacinths. The snails eat a variety of g plant material, thus are not specific to hyacin The snails offer a promising potential for w hyacinth control. (See also W75-09 (Buchanan-Davidson--Wisconsin)

planners to test some environmental im- of alternative growth patterns for the ain Stem sub-basin of the Colorado et of models relating economic activities to air and water demand and quality are developed. This interim report describes a model which has three components: (1) an input-output model of the sub-basin economy, (2) an air diffusion model projecting the airborne distribution of residuals over the region, and (3) a hydrologic-salinity model to trace the monthly surface and groundwater flows and salt flows through the system. Included in the analysis are the agriculture, forestry, mining, energy, manufacturing, tertiary industries, and contract construction aspects of the economy. FORTRAN computer programs for hydro-salinity, residuals generation and pollutant dispersion aid in modeling the relationships between economic activities and environmental implications. The hydro-salinity model has an economic buffer which computes water withdrawal demands, consumptive uses and waste loads, and inputs these data into the combined hydro-salinity model. The Air Pollution Generation and Dispersion Model (APGDM) program computes air-borne residuals generation rates and ground-level pollutant patterns, corresponding to the level of economic activity determined by field surveys or by projections of the input-output model. Use conflicts can be identified through such sets of models. (See also W75-07377) (Becker-Wisconsin)

**ECONOMIC ANALYSIS OF EFFLUENT GUIDELINES: MEAT PACKING INDUSTRY,**
Development Planning and Research Associates, Inc., Manhattan, Kans.
R. E. Seltzer, and J. K. Allwood.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-235 303, $6.25 in paper copy, $2.25 in microfiche. Report No EPA-230/2-74-017, May 1974. 164 p, 13 fig, 49 tab. 68-01-1533.

Descriptors: *Food processing industry, *Effluents, *Economic impact, *Water pollution control, *Pollution abatement, Pricing, Waste water treatment, Costs, Foreign trade, Social impact, Investment, Water quality standards, Profit, Employment, Facilities, Industrial wastes.
Identifiers: *Meat packing industry, *Effluent guidelines.

The economic impact of effluent guidelines is assessed for meat packing houses and for slaughterhouses according to size and characteristics. The meat packing and slaughtering industry is characterized by high dollar sales volume and low sales dollar earnings--the after tax earnings in 1972 were 0.8% on sales. Increased costs associated with the implementation of effluent guidelines must be (1) absorbed by meat packers, (2) passed forward to consumers as higher meat prices, (3) passed backwards to suppliers as lower prices for livestock, or (4) some combination of these options; margins in the industry are narrow, so presumably cost increases associated with effluent controls will be passed on primarily as higher retail meat prices. The economic impact analysis, utilizing data developed on industry segments, financial profiles, price effects, and pollution abatement technology and costs, includes effects on pricing, financing, production, employment, community and foreign trade. Plants discharging into municipal sewers will be unaffected by these guidelines. For all other plants, price increases required to meet 1983 standards would be 0.3-0.4% for large, 0.4-0.7% for medium and 1.1-1.25% for small. Plant closures would be greatest among small plants and would affect slaughter-only plants more than meat packers. (Becker-Wisconsin)

**ECONOMIC ANALYSIS OF EFFLUENT GUIDELINES. FERROALLOYS INDUSTRY.**
Kearney (A. T.) and Co., Inc., Chicago, Ill.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-234 045, $5.25 in paper copy, $2.25 in microfiche. Report No EPA-230/2-74-009, June 1974. 131 p, 6 fig, 48 tab. 68-01-1545.

Descriptors: *Air pollution, *Effluents, *Water pollution control, *Economic impact, *Iron alloys, *Pollution abatement, *Industrial wastes, Water quality standards, Steel, Waste water treatment, Investment, Operating costs, Social impact, Pricing, Facilities, Foreign trade, Costs, Cooling towers, Profit.
Identifiers: *Ferroalloys industry, *Effluent guidelines.

Based on the analyzed data and interviews with ferroalloy manufacturers, it is believed that the proposed water pollution control standards (1983 standards--Best Practicable Technology) will have no significant effect on production levels or plant closings in the ferroalloy industry. The analysis of the manufacturing of the four major ferroalloys--ferromanganese, ferrosilicon, ferrochromium, and silico-manganese--includes nine companies, operating 22 plants. To assess the impact of proposed effluent guidelines the following measures were made: (1) the financial impact on the industry as a whole according to several indices, (2) the same analyses on groups of companies, and (3) the impact on prices of ferroalloys based on the maintenance of the industry's historical average level of profitability before taxes. It was found that 14 of the 22 plants already have in operation the equipment necessary to meet 1977 standards and will require only a small investment to meet 1983 standards. For the eight plants needing additional water pollution abatement equipment, a price increase of 1.0-1.3% for 1977 standards and 2.2-2.4% for 1983 standards is necessary to maintain the industry current return on total assets. Other considerations in the future of the ferroalloys industry include air pollution control costs and foreign competition. (Becker-Wisconsin)

**THE ECONOMIC IMPACT OF POLLUTION ABATEMENT: THE CASE OF WATER POLLUTION BY DEGRADABLE ORGANIC MATTER,**
Centraal Planbureau, The Hague (Netherlands).
H. den Hartog.
Occasional Papers No 1, 1973. 71 p, 7 tab, 3 append.

Descriptors: *Economic impact, *Pollution abatement, *Organic matter, *Eutrophication, *Input-output analysis, Decomposing organic matter, Water pollution control, Legislation, Europe, Mathematical models, Financing, Gross National Product, Employment, Pollution taxes(Charges), Water quality, Foreign trade.
Identifiers: *Netherlands.

A measurement of the economic consequences of the abatement of water pollution, specifically by degradable organic matter, using direct and indirect policy instruments and a closed input-output model is presented. The input-output model takes into account five sectors of the economy: environmental, which is of primary interest here; agricultural; industrial; construction; and service; but does not include branches of a sector, and therefore can give only global information on an entire sector. The starting point of the model is that environmental policies will create certain activities which are primarily directed at preventing or reducing pollution. The quality standard and the time period for achieving the standard, two important parameters in the model, affect the nature of the expenditure effects and the price effects. In accordance with The Netherlands 1971 Act on Pollution of Surface Waters, the 'polluter pays' principle is assumed. Also discussed are degradable organic pollution and its alleviation by the

methods suggested by results from the model. The limited availability of adequate statistical data on the national level, and the segmentation of the larger topic of water pollution control into the specific area of water pollution by degradable organic matter leave the results of the model study clouded. Petroleum Engineer, Vol 45, No 9, p 42-46, August, 1973. 3 fig, 3 tab.

Descriptors: *Pollution abatement, Technology, Design, Methodology, Oil industry, Oil pollution, Industrial production, Water pollution, Air pollution, Pollutant identification, Water pollution control.

Potential pollution causes can be controlled by properly applied technology, though in some cases the technology has not yet become inexpensive enough to be practically applied. Some new technology is needed to meet air emission standards. A technique of evaluating pollution risk of the major subsystems of an overall production system is presented. Specific suggestions and examples of this applied technology are given. (Bradbeer-NWWA)

B(RITISH) C(OLUMBIA) PRESSES FOR FOREST INDUSTRIES CLEAN-UP.
Water and Pollution Control, Vol 113, No 6, p 21-22, June, 1975. 3 illus.

Descriptors: *Water pollution control, *Pulp and paper industry, *Canada, Foreign countries, Legislation, Pollution abatement, Costs, Wastes water(Pollution), Water pollution sources, Industrial wastes, Wastes, Water pollution, Wood wastes, Sulfite liquors.
Identifiers: *British Columbia, Forest industries, Sulfite mills, Floating debris.

Millions of dollars are being spent by British Columbia's forest industry to meet the provincial government's policies on water pollution. The pollution regulations are aimed at controlling waste water discharges and containing floating debris (logging residues and logs) in the waterways. Hardest hit has been the province's pulp and paper industry. The sulfite mills, built at the turn of the century when environmental considerations were not an issue, bear the heaviest costs. Pollution control programs for British Columbia's two sulfite mills, Candian Cellulose Co. (Prince Rupert) and Rayonier Canada Ltd. (Port Alice), are estimated at $95 million. The introduction of pollution abatement equipment at these mills will reduce foaming in the receiving waters, reduce fiber losses, and lower the concentration of pollutants in the waste discharges. Current legislation controlling water pollution is already under review by the provincial government. (Witt-IPC)

Identifiers: Process control, Hardware, Software, *Data acquisition.

The advent of the computer has provided water resources technology with a powerfully efficient tool for the design, planning, management, and operation of water systems. Presented is a state-of-the-art overview of some of the principal considerations in the use of computer systems for water resource practitioners and decision makers. Important trends and issues having impact upon water resources technology are discussed under the general terms of hardware, software, and methodology; focused upon are major areas of computer application in water resources, including data acquisition and management, process control, and system analysis and design. These computer tasks are examined in the contexts of surface water, ground water, and water utilization systems. The methods of dynamic programming, Monte Carlo, Simulation analysis, optimal control theory, relaxation, finite difference, and finite element are considered in the use of computers for surface and ground water systems. The overall issue is whether there should be national possibly international strategies governing the use of computers in water resources. It is recommended that guidelines or agreements be derived in order to establish a comprehensive computer strategy for water resources. Existing and potential principal elements of a structure of the interface between computer systems and water resources technology are considered, i.e., data banks for storage, management and dissemination of information, and a set of problem-oriented computer languages. Arizona Univ., Tucson. Dept. of Watershed Management.
D. K. Larson.
Arizona University, Tucson, Department of Watershed Management, MS Thesis, 1974. 171 p, 19 fig, 36 tab, 4 append, 33 ref.

Descriptors: *Environmental effects, *Colorado River, *Boating, *Balance of nature, *Watershed management, Recreation, Water utilization, Rivers, River regulation, National parks, National recreation areas, Water pollution control
Identifiers: Motor-row issue.

River float trips on the Colorado River through Marble and Grand Canyons dramatically increased within the last ten years, so much so that the National Park Service has decided to reduce the number of river trip participants and require all motorized trips to convert to oar-powered trips by 1977 to reduce the impact on the ecological system. These policies have become major management concerns identified as the motor-row issue which consists of four divisions; limitation of use, perception of wilderness, user agreement with conversion, and user preference for type of trip. Data were collected with self-administrated questionnaires distributed at one pre-trip and four post-trip sites. Results indicated that there was not a definitive positon of the user population regarding conversion, users are divided in their agreement with conversion policies and preference for type of trip. These results will yield definitive conclusions regarding conversion when the National Park Service defines the desired populations of participations through management goals and objectives. Descriptors: *Winter, *Great Lakes, *Ships, *Transportation, *Cost-benefit analysis, Computer programs, Economic impact, Iced lakes, Inland waterways, Estimating, Design, Optimization, Operations, Benefits.
Identifiers: *Shipowners, *Bulk carriers, Ship designs, Winter navigation, Shipping fleets, Investory costs.

The capabilities of a computer program developed to project economic benefits to shipowners from extensions of the operating season are presented. The program inputs data concerning trade routes between most ports on the Great Lakes, ship types, ice types, winter severity, and ship characteristics, with the restrictions that (1) the cargo is iron ore pellets, (2) the ships are U.S. built and operated, with only a moderate degree of automation, and (3) the hulls are largely of mild steel. Outputted by the analysis are: cost of service per ton of cargo, required freight rate, net present value, yield, and capital recovery factor. The computer program is being developed to answer the questions of how best to modify and enhance ships for winter navigation, and how late in the season to continue operations. A description of the computer program and summarized results of several parametric studies using the program are included. Optimization on an individual fleet basis, with the assignment of a different length of operating season to each ship on the basis of efficiency, is considered. Also important in estimating total economic benefits is reduced inventory costs. Conclusions as a result of program output are made concerning extended season shipping on the Great Lakes. ble from the National Technical Informa- ervice, Springfield, Va. 22161, as PB-244 4.75 in paper copy, $2.25 in microfiche. etion Report, June 1975. 67 p, 27 fig, 4 tab, 3 append. OWRT B-028-OKLA(2).

otors: *Design criteria, Operations, *Water s, *Water demand, *Oklahoma, Optimum ment plans, Data collections, Water uses, utilization, Water supply, Pumping, Dairy y, Industrial water.
ers: *Rural water district, Payne Coun- ).

re obtained on Rural Water District No. 3, County, Oklahoma. There was a signifi- ifferent pattern of usage for three classes mers. The average monthly usage per tap rom 8768 to 19183 gallons for dairies, 4357 gallons for Class A taps, and 2537 to 4160 for Class B taps. The average monthly r person ranged from 1424 to 2821 gallons s A taps and from 989 to 1664 gallons for taps. Optimal design values for daily de- re in the range of: 350 gallons per tap; 200 per Class B tap; 350 gallons per Class A gallons per Dairy tap; 12 gallons per dairy ed; 100 gallons per person; 90 gallons per Class B tap; and 150 gallons per person, tap. Optimal design values for peak de- nged from: 1.0 to 1.5 gallons per minute 1.3 to 1.8 gallons per minute per Class A o 0.9 gallons per minute per Class B tap; gallons per minute per person; 0.5 to 0.7 er minute per person, Class A tap; and 0.3 lons per minute per person, Class B tap. al period off-peak pumping time is from 7 a.m., a period of 9 hours.

R. C. Ausness, and B. H. Flynn.
Available from the National Technical Information Service, Springfield, Va. 22161 as PB-244 534, $4.25 in paper copy, $2.25 in microfiche. Research Report No. 86, July 1975. 81 p. OWRT A-060-KY(1). 14-31-0001-5017.

Descriptors: Legal aspects, Legislation, Water law, Water policy, Water Resources Development, *Kentucky, *Water allocation(Policy), *Water distribution(Applied), Consumptive use, *Administration, Navigation, Disposal.

This study discusses navigability concepts, consumptive rights to surface and ground waters, the disposal of diffused surface waters and the administration of Kentucky's statutory water allocation system. Federal regulatory powers are based on navigability as is state ownership of submerged lands. Kentucky uses the ebb-and-flow test of navigability to determine title to submerged lands but uses a navigability-in-fact test to determine the scope of state regulatory authority. Consumptive uses of water in Kentucky are governed by the riparian land-owner to use as much water as he needs as long as his use does not interfere with the legitimate uses of other riparians. Underground streams are subject to the same consumptive use rules, but an overlying landowner can use as much percolating ground water as he needs even though other users are harmed. Kentucky follows the civil law rule with respect to the disposal of diffused surface water, but recent cases seem to have applied the more modern reasonable use rule. In addition to these common-law rules, the Department for Natural Resources and Environmental Protection, under the provisions of KRS Chapter 151, administers a permit system under which both riparian and nonriparian users are allowed to make beneficial uses of water. (Huffsey-Kentucky)

Identifiers: International rivers, Downstream benefits.

Institutional arrangements coping with the problem of water quality in international rivers were examined. Findings are restricted to the evidence available and are tentative only. Both the International Boundary and Water Commission (United States-Mexico) and the International Joint Commission (United States-Canada) are adequately meeting technical problems of quality control in their respective jurisdictions. Political aspects of water policy, however, caused delays in solving the salinity problem on the Colorado River and the downstream benefits issue on the Columbia River. These problems were beyond the jurisdiction of the IBWC and the IJC and necessitated action at higher, policy-making, levels of government.

## 6F. Nonstructural Alternatives

A CASE STUDY OF SOME ECONOMIC ASPECTS OF THE NATIONAL FLOOD INSURANCE PROGRAM,
Mississippi State Univ., Mississippi State. Div. of Business Research.
L. R. Cheatham.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-244 506, $4.25 in paper copy, $2.25 in microfiche. Mississippi Water Resources Research Institute, Mississippi State, Completion Report, July 1975. 56 p, 6 fig, 16 tab, 14 ref. OWRT A-087-MISS(1).

Descriptors: *Flood Plain Insurance, Economics, *Mississippi, *Investment, *Property values, Government supports, Government finance.
Identifiers: Columbus(Miss).

The objective was to determine the impact of federally subsidized flood insurance on urban flood plain development in Columbus, Mississippi. The scope of study was limited to determining the effect on business investment and property values. Evidence indicates that the availability of federally subsidized flood insurance has had little effect on the initial location decisions of either business or non-business properties in Columbus, Mississippi. However, mass flood plain encroachment has occurred since 1968, and there is some evidence that the availability of low-cost insurance may be responsible for businesses and residents remaining on the lands. Data indicate that higher premium rates, which would exist if actuarial rates were charged, would result in a major reduction in the number of policies in force. It appears in the Columbus case that federal disaster aid is more responsible for the current level of commercial investment than subsidized flood insurance.

Descriptors: Flood plains, Management, *Decision making, *Flood plain zoning, *Connecticut, *Mathematical models, *Land use, Model studies, Benefits, Costs, Economics, *Operations research.
Identifiers: *Economic analysis, Farmington(Conn).

Three models are presented from an investigation of the economic potential of land-use management or zoning for a floodplain in Farmington, Connecticut. The analysis demonstrates the potential usefulness of operations research methods to flood zone decision-makers, and it provides a set of (conditional) normative decisions which may be of value to the community under investiation. A review was conducted of the literature concerning applications of quantitative methods of problems of floodplain land-use. The mathematical programming methodology is developed, as is the treatment of the empirical results of the application. A general discussion on the distribution (incidence) of benefits and costs of floodplain land-use management among the various sectors of the society is also presented. The use of mathematical programming can aid land-use decisions by identifying economically optimum land-use patterns. The framework of the three models is flexible enough to include aspects of flood proofing and landfill. The material developed will be used along with that developed in similar studies of other flood water management alternatives to determine an optimum flood management system for the Connecticut River basin.

THE ECONOMICS OF FLOOD INSURANCE: AN ANALYSIS OF THE NATIONAL FLOOD INSURANCE PROGRAM,
Massachusetts Univ., Amherst. Dept. of Agricultural and Food Economics.
G. A. Vaut.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-244 715, $4.75 in paper copy, $2.25 in microfiche. Massachusetts Water Resources Research Center, Amherst, Publication No 46, July 1974. 72 p, 11 tab, 136 ref, Special Report. OWRT B-028-MASS(4) and OWRT B-043-MASS(2).

Descriptors: *Flood plain insurance, Economics, *Risks, *Welfare(Economics), Water policy, Management, Evaluation.
Identifiers: *National Flood Insurance Program.

The purpose was to provide information relevant to the role of flood insurance as a floodplain management/flood loss reduction measure. The first section of the report summarizes the history of the formulation of the current national flood insurance program and its major provisions. The second section assesses the implications for flood insurance of two areas of economic theory: individual behavior under uncertainty and welfare economics. The principle of the existence of a certainty equivalent and risk premium has been established in theory. The existence of a residual degree of risk aversion in some individuals has already been demonstrated to support an economically efficient flood insurance arrangement. Some important policy implications are implied by the lexicographic model developed for this study. A change in status for flood insurance, from an endogenous alternative to an exogenous institutional given, must be recognized by flood plain policy makers.

PRESCRIPTIVE ECONOMIC MODELS FOR NONSTRUCTURAL FLOOD CONTROL,
Cornell Univ., Ithaca, N.Y.
W. F. Bialas.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-244 720, $7.00 in paper copy, $2.25 in microfiche. Technical Report No 97, Cornell University Water Resources and Marine Sciences Center, Ithaca, New York June 1975. 184 p, 21 fig, 2 tab, 68 ref, 4 append. OWRT C-5240(No 4230)(2).

Descriptors: *Flood plains, *Flood plain zoning, *Land use, *Non-structural alternatives, *Linear programming, Alternative planning, Optimization, Economic efficiency, Probability, Equations, Mathematical models, System analysis.

A linear programming model is developed to sel optimal floodplain management plans which reduce damage due to inundation and be econo cally and environmentally sound. The techniqu intended for relatively inexpensive screening floodplain management alternatives before ca ing out a plan-by-plan search with more deta and expensive methods of analysis. Viewing floodplain as a land use allocation problem in th dimensions, this formulation permits a direct sessment of expected flood damage on the basi location and elevation. The model discretizes ti flood losses, topography, and building heig Decision variables include changes in the land allocation in the floodplain; shifts in the acti schema of developed basins can be handled. A the effects of the floodwater displaced by var activities can be explicitly measured and inclu as a component of flood risk. Techniques to count for environmental impact when floo does not occur are also incorportated. The amb concentrations of residuals at each site are ca lated as a function of the degree and type of use activity of all sites. The model defines amount of generated residual to be treated at location to maintain the desired environm quality standards. The standards are themse functions of the land use allocation plan, with plan evaluated on the basis of capital required for land use reallocation, change in rent, and change in residuals treatment cos any. Identifiers: *Oceanographic temperature sensors, *Response time, Platinum resistance sensors, Rotating water container method, Photodiode detector system, Wheatstone bridge.

The response time of three different types of oceanographic platinum resistance temperature sensors was measured employing the conventional rotating water container procedure. At low sensor immersion velocieis (less than 100 cm/s) the response was strongly dependent upon the details of the sensor insertion velocity for one sensor design. With carefully defined measurement procedures, reproducible values for the 'time constant' were obtained, but their application in data analysis must be treated with caution. (Henley-ISWS)

TOMATED HOURLY COMPUTATIONS,
partment of the Environment, Ottawa tario). Water Resources Branch.
W. Stewart.
uary 1975. 68 p, 16 fig.

criptors: *Computer programs, *Data cessing, *Streamflow, *Water levels, State-harge relations, Gages, Discharge(Water), a storage and retrieval, Information retrieval, ormation, Computers.
tifiers: *Hourly.

et of detailed instructions was given to auto- e streamflow and water level computations at cted time intervals by using a digitizer inter- d with a card punch. Detailed instructions for izing water level recorder charts were pro- d to obtain punched cards containing the X-Y dinates. With these cards and the card decks ing the stage-discharge relationships and gage shift corrections, the computer program TRLY (WSC No. J21019) is used to obtain in- aneous gage heights and/or discharges. The wing options are available in this program: (1) ing of the expanded stage-discharge table; (2) ing of the instantaneous discharges or instan- us gage heights, or both, on a selected time val of 15 minutes or 1, 2, 3, 4, 6, or 8 hours, or a selected number of days; (3) card output e instantaneous discharges or instantaneous levels, or both; (4) processing of linear, ed-line,' or 'arc-line' charts (both the ed-line' and the 'arc-line' charts have a d gage height axis but the 'curved-line' have a nonlinear vertical scale and the 'arc- charts have a linear vertical scale.); (5) d output of the chart record as digitized; and otted output of the computed instantaneous arges and/or water levels. **RECHARGE AREAS OF THE FLORIDAN AQUIFER IN SEMINOLE COUNTY AND VICINITY, FLORIDA,**
Geological Survey, Tallahassee, Fla.
C. H. Tibbals.
Florida Bureau of Geology, Tallahassee, Map Series No. 68, 1975. 1 sheet, 3 fig, 6 ref.

Descriptors: *Groundwater recharge, *Groundwater resources, *Aquifer characteristics, *Florida, Hydrologic data, Maps, Water wells, Withdrawal, Water supply, Rainfall, Hydrology, Hydrogeology, Hydrologic budget.
Identifiers: *Seminole County(Fla), *Floridan aquifer, Recharge areas.

The Floridan aquifer is the most important source of water supply in Seminole County, Florida. Virtually all public and domestic water supplies and most of the water used for irrigation are from wells that tap the Floridan. Hence, delineating the areas that recharge the aquifer is important. This map report shows those areas where the Floridan aquifer is subject to recharge or discharge. Recharge to the Floridan aquifer can occur wherever the water table (or a lake surface) is above the potentiometric surface of the Floridan. However, the rate of recharge is governed by: (1) the thickness and permeability of the intervening confining beds and (2) the degree of hydraulic potential, or head difference, between the water-table aquifer and the Floridan aquifer. (Woodard-USGS)
W75-10944

**WATER RESOURCES OF THE LOWER ST. CROIX RIVER WATERSHED, EAST-CENTRAL MINNESOTA,**
Geological Survey, Reston, Va.
G. F. Lindholm, J. O. Helgesen, W. L. Broussard, and D. F. Farrell.
For sale by USGS, Reston, Va 22092, $2.25 per set. Hydrologic Investigations Atlas HA-490, 1974. 3 sheets, 22 ref.

Descriptors: *Water resources, *Watershed management, *Minnesota, *Hydrologic data, Maps, Hydrographs, Climatic data, Hydrologic budget, Water utilization, Surface waters, Groundwater resources, Water resources development, Watershed management, Aquifer characteristics, Streamflow, Water yield, Water quality, Geology, Bedrock, Glacial drift.
Identifiers: *Lower St. Croix River(Minn).

This 3-sheet atlas describes water resources of the lower St. Croix River watershed, east-central Minnesota. Average annual precipitation in the watershed is about 28 inches. Of that amount, about 22 inches is removed by evaporation and transpiration. The average annual runoff is about 6 inches. Virtually all large water users in the watershed obtain water supplies from bedrock aquifers. Withdrawals in 1967 exceeded 1.2 billion gallons. Groundwater is generally very hard, greater than 180 mg/liter. Water from any of the formations may be high in iron, exceeding the recommended limits of 0.3 mg/liter for drinking water. The lower St. Croix River, its tributaries, and many lakes, provide an abundance of water of good quality which is suitable for most industrial, municipal, and agricultural uses. Flooding is not a major problem in the basin. Most flood damage is confined to the vicinity of Lake St. Croix. Streamflow is sustained during dry periods by the large amount of natural storage, both on the surface and in the ground. (Woodard-USGS)
W75-10945

**WATER RESOURCES OF THE SNAKE RIVER WATERSHED, EAST-CENTRAL MINNESOTA,**
Geological Survey, Reston, Va.
G. F. Lindholm, J. O. Helgesen, W. L. Broussard, and D. W. Ericson.
For sale by USGS, Reston, Va 22092, $2.00 per set. Hydrologic Investigations Atlas HA-488, 1974. 3 sheets, 20 ref.

Descriptors: *Water resources, *Watershed management, *Minnesota, *Hydrologic data, Maps, Hydrographs, Groundwater resources, Aquifer characteristics, Hydrology, Water utilization, Water yield, Water quality, Groundwater recharge, Surface waters, Streamflow, Geology, Glacial drift, Bedrock, Evapotranspiration, Soil moisture, Flood frequency.
Identifiers: *Snake River watershed(Minn).

This 3-sheet atlas describes water resources of the Snake River watershed in east-central Minnesota. All domestic, municipal, and industrial water supplies in the watershed are obtained from groundwater sources. Water use is greatest at Mora where withdrawals doubled from 1964 to 1969. Precipitation, the primary source of recharge to the watershed, averaged about 28.9 inches per year during 1939-68. Evapotranspiration, the main discharge process, is generally greatest in July and August, commonly resulting in moisture deficits for optimum plant growth. The average annual runoff from the Snake River basin is about 8.5 inches. Groundwater is generally very hard (greater than 180 mg/liter) and of the calcium magnesium bicarbonate type. The larger base-flow yields in the basin are from streams draining outwash areas. During base-flow periods, a substantial amount of the flow in the Snake River is from groundwater discharging directly to the main channel. Seventy-five percent of the annual minimum flows in the lower reaches of the Snake River occur late in the winter. (Woodard-USGS)
W75-10946

**WATER RESOURCES OF THE LOWER MINNESOTA RIVER WATERSHED, SOUTH-CENTRAL MINNESOTA,**
Geological Survey, Reston, Va.
H. W. Anderson, Jr., D. F. Farrell, and W. L. Broussard.
For sale by USGS, Denver, Colo 80225, and Reston, Va 22092, $2.25 per set. Hydrologic Investigations Atlas HA-526, 1974. 3 sheets, 9 ref.

Descriptors: *Water resources, *Watershed management, *Minnesota, *Hydrologic data, Maps, Hydrographs, Groundwater resources, Streamflow, Runoff, Water quality, Hydrology, Hydrologic budget, Water utilization, Aquifer characteristics, Water yield, Groundwater recharge, Glacial drift, Evaluation, Geology.
Identifiers: *Lower Minnesota River(Minn).

This 3-sheet atlas describes the water resources in the Lower Minnesota River watershed in south-central Minnesota. The main sources of water are precipitation and flow in the Minnesota River, which enters the watershed from the south. All municipalities use groundwater supplies. Glacial sand and gravel are widely used aquifers in the west. The Dresbach, Jordan, and St. Peter aquifers are the most reliable and widely used in the central and eastern parts. The use of groundwater is about 12,000 million gallons per year. This estimate represents 0.34 inch of water used compared with 28.8 inches of precipitation, 24.3 inches of evapotranspiration, and 4.5 inches of runoff. Considerably more water could be used without seriously depleting the amount of groundwater in storage or affecting the water budget. Dissolved solids, sulfate, and bicarbonate concentrations in water from glacial deposits decrease generally from west to east. Dissolved solids range from 900 mg/liter from areas of gray till to generally less than 400 mg/liter from areas of red till and from outwash deposits. Runoff is greatest in the spring and early summer, after the spring breakup. Ru-

noff may be high locally in the summer after intense storms. (Woodard-USGS)
W75-10947

**WATER RESOURCES OF THE CANNON RIVER WATERSHED, SOUTHEASTERN MINNESOTA,**
Geological Survey, Reston, Va.
H. W. Anderson, Jr., D. F. Farrell, W. L. Broussard, and P. E. Felsheim.
For sale by USGS, Denver, Colo 80225 and Reston, Va 22092, $2.25 per set. Hydrologic Investigations Atlas HA-522, 1974. 3 sheets, 6 ref.

Descriptors: *Water resources, *Watershed management, *Minnesota, *Hydrologic data, Maps, Hydrographs, Surface waters, Streamflow, Runoff, Sediment transport, Water quality, Groundwater resources, Aquifer characteristics, Hydrology, Geology, Water yield, Water utilization, Hydrologic budget, Water supply.
Identifiers: *Cannon River watershed(Minn).

This 3-sheet atlas describes the water resources of the Cannon River watershed in southeastern Minnesota. The 1,462 square miles of land surface in the watershed varies considerably from areas of low hills and plains to areas dominated by streams deeply incised into bedrock. Water entering the watershed as precipitation is approximately equal to surface runoff plus evapotranspiration. No significant areas of groundwater decline are known, indicating that the volume of water in storage is fairly constant. Water use in 1970 for public supply, rural supply, and self supplied (industrial and thermoelectric power), was 6,423 million gallons of groundwater and 26,216 million gallons of surface water. The population that year was 84,000. (Woodard-USGS)
W75-10948

**THE HYDROLOGIC CYCLE--AS APPLICABLE TO THE PACIFIC NORTHWEST,**
Geological Survey, Tacoma, Wash.
D. Molenaar.
Available from Washington State Dept. of Ecology, Tacoma, Wash, $1.00 in paper copy. Washington State Department of Ecology, Olympia, Geohydrologic Monograph 4, 1975. 1 map.

Descriptors: *Maps, *Hydrologic cycle, *Pacific Northwest US, Climatic zones, Precipitation(Atmospheric), Runoff, Surface waters, Groundwater, Hydrology, Evaporation, Evapotranspiration, Transpiration.

This map of the hydrologic cycle representative of conditions in the Pacific Northwest, shows the pattern of water movement as it circulates through the natural system--as precipitation from the atmosphere to the earth, as surface runoff and streamflow to the sea, as percolation into the ground and seepage back to the surface, and as evaporation and transpiration back to the atmosphere. Precipitation as rain and snow is the source of all freshwater. A part of the precipitation runs off rapidly to streams, and a part is evaporated directly back to the atmosphere from the ground and from lakes, streams, and plant surfaces. A part soaks into the soil where some is drawn up by plants and returns to the atmosphere by evapotranspiration through and from the leaves; the remainder percolates downward to a zone of saturation to become groundwater. In turn, most of the groundwater returns to the surface-water system by seepage to springs, lakes, streams, and the sea. The Pacific Northwest is a land of climatic and topographic contrasts that are reflected as extremes in natural hydrologic conditions. Average annual precipitation varies widely, from more than 200 inches at places in the higher mountains to less than 8 inches in the semiarid region east of the Cascade Range. (Woodard-USGS)

Oilweek, Vol 23, No 51, p 27-28, February 5, 1973. 2 fig.

Descriptors: *Analytical techniques, *Data processing, *Exploration, *Mapping, *Logging(Recording), *Resistivity, Porosity, Permeability, Regional analysis, Computer analysis, Data storage and retrieval.
Identifiers: Spontaneous potential.

Applying long-standing techniques used in interpretation of seismic data to well logs could increase the level of information gained. Automatic scanning systems now offer a highly accurate method of transcribing graphically-recorded log data to a digital tape. Once these are in common use data from logs can be used for more than location of stratigraphic traps. Porosity, apparent water, resistivity, lithology, radioactivity, density, velocity, and ratios of these can be easily assembled and used in regional exploration. Two examples are presented from the Anadarko Basin in western Oklahoma, and from the northeastern Williston Basin in southeastern Saskatchawan. (Bradbeer-NWWA)

In: Hydrology Symposium, Armidale, Australia, 1975. The Institution of Engineers Australia, Preprints of Papers, p 80-84, May 1975. 2 fig, 6 tab, 9 ref.

Descriptors: *Statistical methods, *Analytical techniques, *Hydrologic data, *Time series analysis, Rainfall, Land clearing, Rain gages.
Identifiers: Non-parametric statistics.

The sophistication of techniques used in an analysis should be in keeping with the quality and extent of the data as most hydrologic data are fairly rudimentary, for example rain guage measurements, simple analysis techniques are an appropriate first step. Some uses for non-parametric statistics are discussed, with particular emphasis on the detection of change in time sequences. A decrease of 4% in measured rainfall following clearing around a rain gauge was found to be significant. A control record is essential to detect such a small change. Changes of the order of 20% can be detected from individual records. (CSIRO)

Descriptors: *Patents, *Beach erosion, *Shore protection, Waves(Water), Ocean waves, Coastal structures, Sea walls.
Identifiers: Hollow concrete blocks.

A beach erosion control structure is described as a perforate wall that includes multiple courses of cored concrete blocks laid on their side so that the core holes provide horizontal passageways through the wall for the flow of water and entrained sand in incoming waves. The multiple rows of such blocks are arranged in such manner that the core holes of adjacent rows of blocks are staggered. The blocks can be preassembled by securing individual blocks into like block units, each block unit having three blocks assembled in a longitudinally staggered side-by-side relationship such that the core holes in adjacent blocks are offset. Such a wall may be laid up without the use of mortar. Instead, mechanical fastening, such as crimped straps, may be employed to couple adjacent courses to each other. Some or all of the block openings may be provided with reed or flapper-type valves which are swung open by an incoming wave, and then move to a partially closed position to resist or restrict the flow of water in ebbing waves. Identifiers: Finite difference analysis.

A numerical model based on the equations of unsteady flow in open channels was used to compute unsteady flows in rivers and reservoirs. The cross sections of the waterways ranged from uniform to highly irregular, the type of flow ranged from slowly varied to abrupt changes in discharge, and nearly all combinations of boundary conditions were encountered. The model used an implicit finite difference method. The versatility, accuracy, stability, and efficiency of the method was demonstrated by field measurements. (Jess-ISWS)

**HORIZONTAL GROUNDWATER COLLECTORS, HYDRAULICS AND DESIGN,**
International Water Supply Ltd., Montreal (Quebec).
P. O. Bourgeois.
In: Proceedings of the Annual Conference of the British Columbia Water and Waste Association, April 9-11, 1974, Vancouver, British Columbia, p 93-106. 5 fig.

Descriptors: *Water supply, *Groundwater resources, *Aquifers, Wells, Hydrology, Recharge, Hydraulic design, Water wells, *Caissons.
Identifiers: *Horizontal groundwater collector.

A horizontal groundwater collector or radial screen well is a large diameter concrete caisson with several screens driven laterally from its lower level outwards through sand and gravel near a stream or lake. It is used to abstract groundwater from an unconsolidated aquifer hydraulically connected to a body of surface water. A summary is presented of hydrodynamic principles which are used to determine yield, design and development of horizontal groundwater collectors. Field testing and analysis of yield includes: test drilling to establish the real extent of the aquifer and its stratigraphic characteristics; pumping tests to establish the characteristics of the aquifer such as transmissibility, permeability, and coefficient of storage which can then be used to determine the contribution of recharge of the adjacent stream; and, collector yield calculations which involve the above information plus the effective radius of the collector which is defined as the equivalent radius of a vertical well which under the same conditions of drawdown would produce an equivalent yield. Caisson design, lateral drain design, and screens selection are also discussed. Additional research is needed to improve on the methods described for obtaining and using the basic information required in determining the hydraulics for arriving at a collector design. (Orr-FIRL)

**HORIZONTAL GROUNDWATER COLLECTORS, 'CANADA'S LARGEST WATER WELL',**
Prince George City Engineer's Office (British Columbia).
C. E. Obst.
In: Proceedings of the Annual Conference of the British Columbia Water and Waste Association, April 9-11, 1974, Vancouver, British Columbia, p 107-123. 8 fig.

Descriptors: *Water supply, *Groundwa resources, *Aquifers, Wells, Costs, Hydrolo Infiltration galleries, Water sources, Pota water, Hydrodynamics, *Water wells, *Cana *Caissons.
Identifiers: *Horizontal groundwater collectors

The City of Prince George, British Columbia, situated planning in 1970 for methods to increase their supply of potable water. The choices included: duplication of a successful and inexpensive infiltration gallery; a raw water intake from the Nechako River with a conventional water treatment plant; and, groundwater supply from the Nechako Aquifer. The installation of a single collector well with horizontal well screen was chosen as the most viable alternative. Details of the exploratory investigation (test drilling and pumping) and examination of the preliminary hydrogeology are presented. The results established that a groundwater aquifer existed, that the water quality from test pumping was acceptable, that the recharge capability of the aquifer was good and the grain size analysis of the granular soil appeared to be acceptable for a sand-free well development. The design and construction of the collector is outlined. The total project costs were $1,125,000 or less than ten cents per gallon capacity for the total capital cost of intake, treatment and pumping. It is concluded that the original objective of Prince George of providing a safe, abundant supply of high quality potable water at the possible cost has been achieved through the installation of a horizontal collector well. **SOME RESULTS ON MASS TRANSFER PROCESSES IN A DENSITY-STRATIFIED FLOW,**
Mississippi Univ., University. Dept. of Mechanical Engineering.
J. A. Fox, L. A. Roe, and C. V. Alonso.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-692, $3.75 in paper copy, $2.25 in microfiche. Mississippi Water Resources Research Institute Mississippi State, Completion Report, August 19 p, 10 fig, 22 ref. OWRT A-081-MISS(1).

Descriptors: *Flow characteristics, *D stratification, Diffusion, Shear flow, L Reservoirs, *Stratified flow, *Mass tra Saline water, *Mixing, Eddies, Turbu *Turbulent flow.
Identifiers: Richardson number.

A stream of relatively pure water was m flow over a body of heavier, saline wate general aim was to study the mixing betwe two fluids of different density. This proce investigated in two laboratory flumes and t were analyzed with a view toward obtainin titative estimates of mixing. The main con presenting the results is in the relation Richardson number to turbulent mixing a vertical eddy diffusivity coefficient. The ex of a high local Richardson number of a fresh water over a saline solution lower the vicinity of the interface between the two seems to inhibit turbulent mixing. Th Richardson number approaches zero awa the interface on either side of it. Indirect tion of the vertical eddy diffusivity co from experimental data shows a strong with Richardson number between zero and the flows considered, indicating a strong with increasing Richardson number.

CTS OF ENTRANCE LOSS ON HARBOR LLATIONS,
a Univ., Gainesville. Dept. of Coastal and ographic Engineering.
luata, and C. C. Mei.
l of the Waterways, Harbors and Coastal eering Division, American Soceity of Civil eers, Vol 101, No WW2, Proceedings Paper p 161-180, May 1975. 4 fig, 2 tab, 14 ref, 2 d. ONR Contracts NO0014-67-A-0204-0036, 2-338.

ptors: *Waves(Water), *Harbors, *Friction, ratory tests, *Mathematical studies, nance, Velocity, Head loss, Coastal en- ng, Tsunamis, Fluctuations.
iers: Harmonics.

The results of a theoretical study of wave induced response in a rectangular model harbor was reported. It was assumed that friction head loss was present across the harbor entrance. The loss was assumed to be quadratic in local velocity with a constant friction coefficient. Bottom and side-wall dissipation were not considered. It was shown that odd higher harmonics were present. The resonance characteristics of the fundamental harmonic response in the harbor were significantly influenced by the additional damping due to friction, especially for the lowest peaks. While in the perfect fluid theory, these peaks heighten with diminishing entrace width; in the presence of friction, the opposite was true for a sufficiently narrow mouth. (Bhowmik-ISWS)

**TURBULENT STRUCTURE NEAR SMOOTH BOUNDARY,**
Stone and Webster Engineering Corp., Denver, Colo.
P. H. Blinco, and D. B. Simons.
Journal of the Engineering Mechanics Division, Proceedings of American Society of Civil Engineers, Vol 101, No EM3, Paper 11372, p 241-255, June 1975. 11 fig, 16 ref, 2 append.

Descriptors: *Turbulence, *Boundary layers, *Time series analysis, *Flow characteristics, Reynolds number, Laboratory tests, Analysis, Fluid mechanics, Shear stress, Boundaries(Surfaces), Shear, Anemometers.
Identifiers: *Turbulent structure, *Energy spectra, Boundary shear, Hot film anemometers.

Digital time series analysis of constant temperature hot film anemometer signals were analyzed for a Reynolds number range from 18,600 to 136,000. A miniature boundary layer type sensor and a Flush Surface Hot-Film sensor were used in a smooth boundaried tilting flume. Results of the analysis revealed that: (1) the instantaneous boundary shear stress was a low frequency process with most of its spectral energy associated with frequencies below 5 Hz; (2) the spectral distributions were dependent on the bulk flow variables with higher frequency energy content increasing with increasing Reynolds number; (3) decomposition of the instantaneous boundary shear stress into an extreme value counting process was shown to agree with the so-called 'bursting process'; (4) the mean period between shear stress excursions varied with the 3/4 power of the Reynolds number and, when made dimensionless by use of the bulk flow variables, the mean bursting was a constant; and (5) time-space correlation between the longitudinal velocity fluctuations and the boundary shear stress indicated that a large inclined turbulent structure was responsible for the transfer of turbulence into the viscous sublayer. **TRANSITION IN OSCILLATORY FLOW OVER RIPPLED BEDS,**
Cambridge Univ., (England). Dept. of Engineering.
J. F. A. Sleath.
The Institution of Civil Engineers Proceedings, Part 2, Research and Theory, Vol 59, p 309-322, June 1975. 7 fig, 1 tab, 13 ref.

Descriptors: *Turbulent flow, *Transition flow, *Laminar flow, Fluid mechanics, Anemometers, Reynolds number, Hydraulics, Hydrodynamics, Beds, Ripple marks, Sand waves, Velocity.
Identifiers: *Oscillatory flow, *Rippled bed, Flow stability, Velocity measurements, Random instability.

Velocity measurements were made in order to investigate the way in which oscillatory flow over rippled beds become turbulent. The tests were carried out with a range of rippled beds oscillated in still air and water and a hot wire anemometer was used to measure the velocity. For a given bed and amplitude of oscillation, it was observed that below a certain critical frequency of oscillation the flow remained laminar. At higher frequencies random instabilities appeared. Depending on the amplitude of oscillation, these instabilities may reach a limiting value as frequency is increased still further, or they may eventually break down into turbulence. A curve was proposed for the conditions under which the random instabilities first appeared. Conclusions were drawn as to the conditions under which flow produced by wave action over a rippled bed is laminar or turbulent. It was suggested that the observed instability is indepenedent of transition caused by grain roughness, which may be calculated separately. (Lee-ISWS)

**THE DESIGN OF STORM WATER DRAINAGE CHANNELS USING MATHEMATICAL MODEL TECHNIQUES,**
Hydraulics Research Station, Wallingford (England).
W. R. White, and R. K. Price.
The Institution of Civil Engineers Proceedings, Part 2, Research and Theory, Vol 59, p 91-102, March 1975. 8 fig, 3 tab, 9 ref, 1 append.

Descriptors: *Storm runoff, *Storm drains, *Urban drainage, *Urban hydrology, *Mathematical models, *Open channel flow, Urban runoff, Open channels, Routing, Unsteady flow, Continuity equations, Momentum equation, Flood routing, Drainage systems, Networks, Hydrographs.
Identifiers: *Colebrook-White transition. *Airport drainage.

The hydraulic aspects of the design of drainage schemes, the main arterial branches of which consist of open channels, were described. The Road Research Laboratory hydrograph technique was applied to the subsidiary pipe network system, but a new mathematical model technique was used for the main drainage channels. The spatially varied unsteady flow conditions within these channels were analyzed using a full solution of the equations governing continuity, momentum, and frictional resistance, the latter being defined in terms of the Colebrook-White transitional law. The new method was used in a feasibility study to determine the optimum drainage system for the proposed Maplin airport-seaport development and results from this investigation illustrated the method. **PREDICTING CAVITATION IN SUDDEN ENLARGEMENTS,**
Colorado State Univ., Fort Collins. Hydro Machinery Lab.
J. W. Ball, J. P. Tullis, and T. Stripling.
Journal of the Hydraulics Division, Proceedings of American Society of Civil Engineers, Vol 101, No HY7, Paper 11442, p 857-870, July 1975. 5 fig, 2 tab, 17 ref, 2 append.

Descriptors: *Cavitation, *Pitting(Corrosion), *Orifices, *Hydraulics, Energy dissipation, Valves, Pressure, Water conveyance, Nozzles, Water levels, Damages, *Design criteria, *Forecasting.
Identifiers: *Scaling effects, *Pressure effects.

In recent years incipient, critical, and choking cavitation levels have been introduced as design criteria for orifices and valves in pipelines. Recent studies have evaluated a fourth level, incipient cavitation damage, for orifices that is applicable to the design of sudden-enlargement energy dissipators. Design data for these four levels were included in the paper. Since cavitation in prototype structures can differ from that predicted by model studies, research was also directed toward evaluation of scale effects. The existence of scale effects due to pressure, size, and geometry for four levels

of cavitation was examined herein, and methods and equations for adjusting reference test data to structures of other sizes operating under different pressure conditions were presented. The location and distribution of cavitation pitting on the pipe wall downstream from the sudden enlargement was identified. The pitting was a function of expansion ratio and cavitation intensity. G. L. Beichley, and D. L. King.
Journal of the Hydraulics Division, Proceedings of American Society of Civil Engineers, Vol 101, No HY7, Paper 11462, p 829-846, July 1975. 10 fig, 1 ref, append.

Descriptors: *Cavitation, *Outlet works, *Flow around objects, *Hydraulic models, *Slide gates, Hydraulic structures, Jets, Discharge(Water), Spillways, Aeration, Erosion.
Identifiers: *Offsets, Palisades Dam, Navajo Dam, Pueblo Dam, Crystal Dam, Teton Dam, Slots, Deflectors.

To prevent cavitation erosion, air may be introduced along the underside and sides of a jet before the jet comes in contact with downstream concrete surfaces. Model studies of chute offsets, air slots, and deflectors were conducted to determine methods to aerate the jet and provide recommendations for altering two existing structures and designing new structures. A single test facility was used to model existing structures at Palisades and Navajo Dams and proposed structures at Pueblo, Crystal, and Teton Dams. Wall air vent slots combined with a floor deflector were developed for use immediately downstream from the gate frames in the two existing structures. Wall and floor air vent offsets away from the flow at the end of the frame were developed for new structures. These investigations, supplemented by general tests, formed the basis for guidelines developed for design of future air-entraining devices to protect flow surfaces from cavitation erosion. The best dimensions and locations for the slots and offsets were discussed, based on models of these specific structures. (Lardner-ISWS)

Descriptors: *Waves(Water), *Open channel flow, Hydraulic transients, Unsteady flow, Velocity, Flow, Surges, Bores, Dam failure.

A three-year (1968-71) study is described in which laboratory measurements of some of the characteristics of one-dimensional waves in a channel were compared with values computed from a particular mathematical model and solution procedure. When boundary conditions, initial conditions, and channel geometry are accurately specified as input to the mathematical model, the leap-frog explicit solution scheme provides an accurate representation of the physical situation. The hydrogen bubble technique is a practical and feasible method for determining velocities in unsteady flow. Within the limits of the test data, neither the amplitude of the wave released into the channel nor the initial depth of water in the channel had an appreciable effect on the agreement between computed and measured values. For wave releases into a steady flow, proper specification of initial and boundary conditions for the model becomes more critical, and accurate experimental measurements are more difficult to obtain.

A SOLUTION TO PUMP STOPPAGES,
Irvine Ranch Water District, Calif.
S. Nelson.
Water and Sewage Works, Vol 121, No 9, p 106, September 1974.

Descriptors: *Pumps, *Sludge digestion, Solids, Flow, *Sewage treatment, *Waste water treatment, Treatment facilities, Equipment.
Identifiers: Comminutor/Macerator, Irvine Ranch Water District.

One problem in sludge digestion and treatment is the stoppage of waste pumps. This is caused by large articles such as cans, bottles, rags, and sticks which get pumped along with primary sludge to an aerobic digester, then to drying beds where they cause the pumps to become inoperative. The Irvine Ranch Water District has solved this problem by the use of a new unit called the Disposable Waste Systems Comminutor/Macerator, installed in the influent channel. This six inch model processes solid material prior to any pump action. The unit can run unattended for several months. The Irvine Ranch Water treatment plant has been using this machine for eight months continuously. Primary sludge and skimming pumps that feed the Comminutor/Macerator share a common discharge line; flow can be to both pumps at once or to either individually. Three new Comminutor/Macerators, 40 inch models, will be installed in the system in the near future. (Prague-FIRL)

PITLESS ADAPTERS: EMPHASIS ON SANITATION,
Environmental Protection Agency, Washington, D.C. Div. of Water Supply.
W. J. Witsell.
Water Well Journal, Vol 29, No 4, p 56-58, April, 1975. 1 fig.

Descriptors: *Casings, *Wells, *Well regulations, *Pollution, Frost protection, Corrosion, Quality control, *Environmental sanitation.
Identifiers: *Pitless adapters, *Well pits, Pitless units, Poisonous gases, Well head.

Because of the pollution hazards involved, a well pit to house pumping equipment or to permit accessibility to the top of a water well is not recommended and, in some cases, is prohibited. The two general types of pitless installations are the pitless adapter, which connects the well from below the frost line to the pumping components, and the pitless unit which is an entire unit mounted on the well casing that has been cut off at the required depth. Problems of installation in this type of equipment often arise. Welding below ground is not conducive to good workmanship. Similarly, achieving a watertight joint is difficult. Clamps and gaskets for attachment of adapters and units are often criticized for their structural weakness. Compatibility between metals on the well, the pitless device, and the welding materials is necessary. Finally, provision for settlement of the well head is necessary. Procedures for inspecting and testing the pitless installations are important as they are installed within the zone of greatest corrosion and contamination potential within the upper 10 feet of the well structure. Testing procedures are outlined. (Bradbeer-NWWA)

COLORADO CITY SOLVES ITS SAND PUMPING PROBLEMS,
Wright Water Engineers, Inc., Denver, Colo.
R. D. Tafelski.
Johnson Drillers Journal, p 1-3, March-April, 1975. 2 fig.

Descriptors: *Groundwater, *Sands, *Pumping, *Quality control, *Well filters, Well casings, Well screens, Gravels, Wells, Water wells, Sand aquifers, Filters, Silting, Sediment control, *Colorado.
Identifiers: *Burlington(Colo), *Sand pumping, *Ogallala aquifer, Pierre shale.

Investigations into the problem of sand pumping wells in Burlington, Colorado were made in 1973. Initial pumping in each well produced sand. Continued pumping reduced the amount of sand. As the problem worsened with time, the decision was made to drill a series of replacement wells. The new wells completely pierced the Ogallala and continued five feet into the Pierre shale. The size of the gravel pack was reduced and polyphosphates were introduced to aid in breaking down any mudcake on the borehole walls. The well was developed with careful backwashing to prevent the disruption of the gravel pack. The resulting wells produced sand-free water. (Bradbeer-NWWA)

WILL SUBMERSIBLES MAKE JET PUMPS OBSOLETE.
Water Well Journal, Vol 29, No 4, p 53-54, April, 1975.

Descriptors: *Pumps, *Cost comparison, *Cost analysis, Jets, Hydraulic equipment, Equipment, Performance, Deep-well pumping.
Identifiers: *Submersible pump, *Injector pump, *Ejector pump, Jet pump, Working head pump.

A comparison of the relative costs, capacities and working depths of the three types of pumps, working head, ejector and submersible, is made. Costs of installation are competitive at settings from 100 to 500 feet. The jet pump, or ejector alone, is cheapest but its cost rises when the cost of extra pipe length is added. The submersible pump is the most costly to manufacture but requires less pipe and cable to operated. The installation, access and repair of the jet pump are simplest of the three; but it has limitations as to the depth of installation. In wells of 4-inch diameter or larger and settings below 80 feet, the submersible pump develops the greatest volume of water per horsepower. The deeper the setting, the greater the capacity and horsepower advantage for the submersible. The deep well working head pump can be used in wells of narrower diameter. For wells of less than 100 feet, the ejector pump is best in price, capacity and installation ease. (Bradbeer-NWWA)

Water Well Journal, Vol 29, No 4, p 47-48, April, 1975.

Descriptors: *Pump testing, *Pumps, Planning, Loads(Forces), Well capacity, Aquifer properties, Power lead, Performance, Quality control, Hydraulic systems, Wells, Safe yield, Specific capacity.
Identifiers: *Submersibles, *Downhole pumping.

Proper planning and preparation are very important to the successful installation of a submersible pump and provide the best insurance against lost time on the job of installation. Well capacity should be predetermined to prevent over-pumping. Pre-installation checks of voltage capacity prevents burnouts. Other checks on wire size, length and placement of splices are common sense. A pump should be handled carefully and tested fully placing it downhole. Some tests for shipping damage are suggested. Once the submersible is emplaced careful operation should be the rule to insure maximum lifetime of the pump. (Bradbeer-NWWA)

**UNCONVENTIONAL AIR DRILLING REDUCES WELL COSTS.**
World Oil, Vol 178, No 7, p 91-93, June, 1974. 2 tab, 1 ref.

Descriptors: *Drilling, *Costs, Groundwater, Drilling equipment, Test wells, Borehole, Drilling fluid.
Identifiers: *Air drilling, Drilling techniques.

Data including penetration rates, number of bits per hole and a description of the cored formation as well as the drill bit types and sizes, pressures used and weight of the bits are tabulated and evaluated for two recent exploratory drilling programs by Shell Oil Company that involved air drilling. The costs reported illustrate the economic advantages of air drilling. (Bradbeer-NWWA)
W75-11270

**DRILLING RATE AFFECTS COSTS MORE THAN BIT LIFE,**
Sandia Labs., Albuquerque, N. Mex.
R. J. Lawrence.
Oil and Gas Journal, Vol 73, No 22, p 130-132, June 2, 1975. 3 fig, 4 ref.

Descriptors: *Drilling equipment, *Cost analysis, Economics, Evaluation, Equipment, Cost-benefit analysis, Wells, Efficiencies, Groundwater, Oil.
Identifiers: *Drilling rate, *Drill bit design, Cost reduction.

To simplify the economic evaluation of drilling costs it can be assumed that logging, casing, and completion costs are essentially fixed and independent of both drilling rate and drill bit life, the two areas open to improvement. Rotating and tripping costs are thus the only factors considered. Drilling rate is more significant than improved bit life from an economic point of view. Two examples to demonstrate this fact are given. (Bradbeer-NWWA)
W75-11279

**'SELF-TAPPING SCREW' BIT WOULD USE LIGHTER WEIGHTS,**
J. L. Kennedy.
Oil and Gas Journal, Vol 72, No 13, p 122-126, April 1, 1974. 11 fig, 1 ref.

Descriptors: *Drilling equipment, *Design criteria, *Penetration, *Weight, Pressure, Wells, Groundwater, Rotary drilling, Water wells.
Identifiers: *Drill bit, *Conical bit, Drilling rate.

A conical bit which uses its cutting to generate thrust forces is the basis of a program to develop a new boring technique. Because of the forces the bit requires only about 10% of the thrust of a conventional bit of similar diameter. The shape of the bit provides more cutting structure and produces a wedge-like effect on the rock. Cleaning should be improved as rock chips would not be caught under the bit. Also, if the side force generated is large enough or if the hole-bottom angle is small enough, the borer can be made self-advancing. Tests indicate the advantages of the conical bit. (Bradbeer-NWWA)
W75-11283

**HOW TO SEAL TUBING COLLAR LEAKS.**
Petroleum Engineer, Vol 45, No 6, p 66, June, 1973. 1 fig.

Descriptors: *Leakage, *Water wells, *Oil wells, *Linings, Technology, *Texas, Pressure Methodology, Seepage.
Identifiers: *Tubing collar, Bee County(Tex).

The technical solution to an actual problem case in Bee County, Texas is discussed. A leak in 2-inch tubing collar at 448 feet with tubing pressure 4150 psi and casing pressure 2000 psi was repaired in 5 hours with a 10-foot long steel liner. (Bradbeer-NWWA)
W75-11287

**WATER SYSTEM ACCESSORIES,**
W. Romano.
Water Well Journal, Vol 29, No 4, p 50-51, April, 1975.

Descriptors: *Water supply development, *Pumps, *Water pressure, *Public utilities, Overflow, Water rates, Water utilization, Water storage.
Identifiers: *Water system accessories, Pressure switch, Relief valve, Pressure tank.

A pump alone cannot provide automatic running water under pressure in all cases. Certain other accessories are needed and the combination of these forms a water system. The motor, the pressure switch, the relief valve, and the pressure tanks are basic components of a water system and provide the regulation of the amount of water pumped. A formula for estimating the pressure tank size necessary is presented, and examples are given. A larger than normal tank can be used to increase the useable volume of water in a slow producing well. An example of this is given. (Bradbeer-NWWA)

ntifiers: *Water jets.

initiation of fracture in a rock mass subjected he impingement of a continuous water jet has n studied. The jet is assumed to place a quasi- c pressure loading on the surface of the rock, ch is treated as a saturated, porous-elastic, opic, and homogeneous half-space. While this sure loading is held constant, the impinging r flows through the rock according to Darcy's and pressurizes the fluid in the pores. The pore sure distribution couples with the stress field lo the surface loading to produce an effective- s field, which can start tensile fracturing tly under the load. At various time intervals initial impingement, the effective-stress field mputed using finite element methods and the ts, together with the Griffith criterion for ten- ailure, produce the loci of the zones of frac- initiation. The behavior of these zones is dis- d as a function of the two jet parameters -- ure and nozzle diameter -- and the five rock erties: Young's modulus, Poisson's ratio, ten- trength, porosity and permeability, and time. rimental verification of the role of pore pres- was made in a laboratory study which is ibed. **TECHNIQUES FOR LINEAR TIE-BACK CEMENTING,**
MWL Tool and Supply Co., Midland, Tex.
H. E. Lindsey, Jr.
Petroleum Engineer, Vol 45, No 7, p 40-44, July, 1973. 1 fig.

Descriptors: *Linings, *Well casings, *Cements, Circulation, Sealants, Water wells, Oil wells, Deep wells, Groundwater, Leakage.
Identifiers: *Cementing, *Casing, strings, Cement placement.

Tie-back liners or casing strings are cemented to protect other casing in the well against pressure or corrosion, to close a leak, to add to confining strength or to cover worn or damaged casings. A tie-back liner usually extends from the top of a liner back to the surface but may extend only partially up the hole from the production liner. The two methods of cement placement around tie-back strings are by: (1) conventional circulation; and (2) reverse circulation. The equipment is different for each method. Which of these procedures is better is determined by the job requirements. (Bradbeer-NWWA)
W75-11277

**HOW BP ALASKA CEMENTS THROUGH PERMAFROST.**
Petroleum Engineering, Vol 45, No 4, p 38-42, April, 1973. 2 fig.

Descriptors: *Cements, *Mixing, *Permafrost, *Tundra, *Alaska, Oil wells, Technique, Portland cements, Gypsum, Concrete technology.
Identifiers: North Slope(Ala), Prudhoe Bay (Alas).

The approximately 2000 foot thick permafrost of Alaska's North Slope creates a unique problem in drilling methods and cement placement. Gypsum-portland cement blends offer an effective cement mixture of usage through permafrost because of their low heat of hydration, stability in freeze-thaw cycles, and wide range of temperature usage. Surface techniques and mixing equipment are described. The inner string cementing technique is used to cement the open hole. This technique along with precautions due to low temperatures is described. Also, three main types of batch mixing are evaluated for use at low temperatures. (Bradbeer-NWWA)
W75-11278

**HOW TO MAKE SQUEEZE CEMENTING SUCCESSFUL,**
Rike Service, New Orleans, La.
J. L. Rike.
Oil and Gas Journal, Vol 72, No 26, p 58-64, July 1, 1974. 3 fig, 3 tab, 20 ref.

Descriptors: *Wells, *Cements, *Slurries, *Sealants, *Methodology, Concrete additives, Concretes, Water wells, Well casings, Pipes, Groundwater.
Identifiers: *Squeeze cementing.

Squeeze cementing is an operation wherein cement slurry is forced under pressure to a specific point in a well, in order to repair casing or a cement job, or to seal the formation from well fluids. The significance of the volume of cement used, and of the pressure of the operation is delineated and the uses of high and low pressure squeeze are shown. Materials used as extenders, retarders, dispersants and accelerators in the cement slurry are described and their relative values are mentioned. Special problems that might aris during the operation such as lost circulation are recounted and control methods are suggested. (Bradbeer-NWWA)
W75-11286

**CASING-SEAT TESTING - WHY AND HOW.**
P. L. Moore.
Oil and Gas Journal, Vol 21, No 32, p 72-74, August 6, 1973. 5 fig.

Descriptors: *Pressure, *Water wells, *Drilling, *Testing, Frequency, *Methodology, Testing procedure, Concrete testing, Non-destructive testing, Quality control, Measurement, Casing, Well casing.
Identifiers: Leak-off, Casing seat, Fracture gradient.

Pressure testing below the casing seat is generally performed to test the cement job, and to determine the fracture gradient in the first sand below the casing shoe. The general procedure is discussed and some examples are given. Special considerations in running leak-off tests include the pumping rate, the decision to test, the pressure to be used, the frequency of testing and the maximum mud weight. These are discussed. (Bradbeer-NWWA)
W75-11291

**CEMENTING TODAY'S PROBLEM WELLS.**
Drilling, Vol 34, No 5, p 20-21, March, 1973.

Descriptors: *Cements, Technology, *Concrete additives, *Concrete technology, *Water wells, Linings, Pozzolans, Slurries, Concrete mixes, Concrete placing, Drilling, Casings, Deep wells.
Identifiers: *Thixotropic cement, Batch mixing(Cement), Continuous mixing(Cement).

The advantages and disadvantages of batch mixing and continuous mixing cement for use in wells are mentioned. Technological improvements of the continuous mixing process are predicted. The problem of cementing hot drill holes is met with a Class J cement in the form of supplements to certain oil well additives. A spacer, a hydrocarbon-based fluid which is compatible with mud and slurry, is credited with improving mud removal. Thixotropic slurries, gelatinous cements, are developed to support incompetent formations. (Bradbeer-NWWA)

**COMPUTER ALGORITHMS USEFUL FOR DETERMINING A SUBSURFACE ELECTRICAL PROFILE VIA HIGH FREQUENCY PROBING,**
California Univ., Livermore. Lawrence Livermore Lab.
D. L. Lager, and R. J. Lytle.
UCRL-51748, February 13, 1975. 14 p, 23 fig, 13 ref. ERDA Contract W-7405-Eng-48.

Descriptors: *Algorithms, *Electromagnetic waves, *Geophysics, Computers, Mathematical studies, Mathematics, Electrical well logging, Exploration, *Subsurface mapping.
Identifiers: *High-frequency probing, ART algorithm, SIRT algorithm, BPT algorithm, Resolving power, Convergence rate, Tomography.

The data inversion algorithms developed in the last few years by investigators in the field of x-ray tomography for producing 3-D reconstructions of the human head and torso from 2-D projections have been applied to the problem of determining the structure of the ground between a pair of drill holes. The 'projections' were made by probing the ground at high frequencies and recording the magnitude and phase of the received signal for various positions of transmit and receive antennas. The region between the holes was divided into rectangular zones (like a checkerboard) and several algorithms were applied to assign appropriate values of electrical permittivity and skin depth to each zone. The three most successful algorithms to date have been modified versions of the tomographer's ART (algebraic reconstruction technique), SIRT (simultaneous iterative reconstruction technique),

and BPT (back projection technique). Results were presented to show the ability of the algorithms to resolve various-sized simulated anomalies that are analogous to voids and ore bodies. Finally, the results of experimental measurements were presented. (Sanderson-ISWS)

CORROSION BY DOMESTIC WATERS,
Illinois State Water Survey, Urbana.
For primary bibliographic entry see Field 5F.
W75-11062

LONGER LIFE FOR SUBMERSIBLES.
Water Well Journal, Vol 29, No 4, p 60, April, 1975.

Descriptors: *Corrosion, *Alkaline materials, *Pitting(Corrosion), *Pumps, Hydraulic equipment, Protection, Corrosion control, Chemical degradation, Water softening, Algae, Bacteria, Acidic water, Submerged, Equipment.
Identifiers: *Soda ash, Submersible pump.

Pitting due to organic growth on a pump and corrosion due to acid well water are two important causes of shorter life for pumps. Pitting occurs when bacteria or algae in well water attach themselves to the metal surface. They create minute electrolytic cells and a voltage differential between the metal under the organism and the water surrounding it. This differential is transmitted by metallic ions transferring into solution leaving behind a pit. Chlorination to kill the organisms can solve this problem. Corrosion by acid well water can be detected by sampling the water. Correction of acid water can be accomplished by addition of alkaline substances such as soda ash at the pump. (Bradbeer-NWWA)
W75-11259

ELECTRICAL TESTS FOR SUBMERSIBLE PUMPS,
R. C. Middleton.
Water Well Journal, Vol 29, No 4, p 61-62, April, 1975. 6 fig.

Descriptors: *Testing procedures, *Electrical equipment, *Resistivity, *Electric currents, Electric motors, Pumps, Water wells, Groundwater, Inspection.
Identifiers: *Submersible pump.

Submersible pump motors are designed to operate within a line-voltage variation limit of approximately plus-or-minus 10 percent. Voltage is suitably measured with a small a-c voltmeter at the control box, as for a single-phase motor, or at the magnetic starter as for a three-phase motor. The test method is shown in a diagram. Difficulties in a submersible pumps can also be caused by excessive current drain. To measure current an a-c ammeter is inserted in series with the line. Current should be measured in each of the three motor lines of a three-phase system, then unequal readings indicate trouble. Insulation resistance can be checked with a high range ohmmeter. Readings of less than 5 million ohms for a new installation indicate a leak in the system. (Bradbeer-NWWA)

THE KINETICS OF CRYSTALLIZATION OF SCALE-FORMING MINERALS,
State Univ. of New York, Buffalo.
G. H. Nancollas, and M. M. Reddy.
Society of Petroleum Engineers Journal, Vol 14, No 2, p 117-126, April, 1974. 8 fig, 1 tab, 32 ref.

Descriptors: *Scaling, *Calcium sulfate, *Calcium carbonate, *Crystal growth, *Growth rates, *Kinetics, Hard water, Activation energy, Electrolytes, Descaling, Groundwater, Wells, Pipes, Phosphates, Water chemistry.
Identifiers: *Calcium sulfate, Scale inhibitors, Second order rate law, Phosphonate.

Reviewed is the kinetics of crystal growth of sparingly soluble minerals such as calcium carbonate, calcium sulfate, and barium sulfate, which frequently cause scaling problems in oil fields. For all three electrolytes, the crystal growth is surface controlled and follows a second-order rate law with an activation energy for the growth process of 10 to 20 kcal mol-1. The growth of calcium sulfate seeded crystal above 100 degrees C demonstrates the importance of characterizing polymorphic transformation processes. Phosphonate scale inhibitors show differing modes of inhibition in systems precipitating CaCO3 and CaSO4. (Bradbeer-NWWA)
W75-11273

DISSOLVED GASES ARE KEY CORROSION CULPRITS,
Petrotech Ltd., London (England).
C. C. Patton.
Oil and Gas Journal, Vol 72, No 29, p 66-69, July 22, 1974. 3 fig, 3 ref.

Descriptors: *Corrosion, *Dissolved oxygen *Electrochemistry, *Hydrogen sulfide, *Carbon dioxide, Flow rate, Aging(Physical), Chemical degradation, Well casings, Well screens, Oxidation, Steel, Chemical reactions, Deterioration.
Identifiers: *Corrosion cell, Dissolved gases.

Corrosion prevention is particularly important as drill pipe becomes scarcer and more precious. Corrosion theory and the susceptibility of steel and other metals to corrosion are discussed. The effects on corrosion rates of dissolved oxygen, carbon dioxide, and hydrogen sulfide are mentioned as well as the effects of physical variables such as fluid velocity and pressure. (Bradbeer-NWWA)

D. J. Timko, and W. H. Fertl.
World Oil, Vol 176, No 1, p 45-48, January, 1973. 7 fig.

Descriptors: *Drilling, *Exploration, *Oil, *Gas, *High pressure, Electrical well logging, Well data, Deep wells, Ground water.
Identifiers: *High pressure gradients.

Proper analysis of log-calculated temperatures and pressures can save millions of dollars by preventing unnecessary drilling and setting of additional casing in unfavorable hydrocarbon environments. How to predict whether commercial production can exist below a given depth in a drilling well is described and - as an example of the analysis method - why certain offshore Texas acreage is an extremely poor hydrocarbon prospect is explained. # 10. SCIENTIFIC AND TECHNICAL INFORMATION

## 10B. Reference and Retrieval

**DEVELOPMENT OF A BIBLIOGRAPHIC INFORMATION SYSTEM FOR WATER YIELD IMPROVEMENT PRACTICES,**
Arizona Univ., Tucson. School of Renewable Natural Resources.
L. M. White, D. B. Thorud, and P. F. Ffolliott.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-244 696, $3.25 in paper copy, $2.25 in microfiche. Completion Report, August 1975. 6 p, 9 ref. OWRT A-042-ARIZ(9). 14-31-0001-3803.

Descriptors: *Information retrieval, Computers, *Bibliographies, *Water yield improvement, *Watershed management, *Arizona, Southwest U.S., Water yield, Forest management, Land management, Water sources, Vegetation effects, Water quality.
Identifiers: Bibliographic searches, Information systems, Literature searches.

Development of the Watershed Management Information System (WAMIS) began in 1972. WAMIS is designed to serve a variety of users who are interested in water and natural resource research in Arizona. WAMIS is a computerized bibliographic reference retrieval system which provides literature searches for users, in the form of individualized computer printouts of citations and abstracts, based upon a user's special interests. The literature covered in WAMIS includes effects of land management practices and vegetation management on water and other related resources, such as forage production, wildlife habitat, timber production, and recreational use. Research done in Arizona has been emphasized. General procedures used in banking and retrieval are described. Types of search requests have varied, including topics such as wildlife use of ponderosa pine forests, environmental and vegetation effects on evapotranspiration, hydrologic

modeling, Arizona water quality data, the effect of timber cutting practices on runoff, and revegetation of treated pinyon-juniper vegetation.
W75-11050

## 10C. Secondary Publication And Distribution

**THE AWARENESS OF THE RELEVANT WATER RESOURCES LITERATURE BY THE PERSONNEL OF THE WISCONSIN DEPARTMENT OF NATURAL RESOURCES,**
Wisconsin Univ., Madison. Library School.
R. D. Walker, G. J. Zuck, R. E. Durrance, and J. R. Luedtke.
Available from the National Technical Information Service, Springfield, Va 22161 as PB-244 500, $4.75 in paper copy, $2.25 in microfiche. Wisconsin Water Resources Center, Madison, Technical Report WIS WRC 75-09, August 1975. 81 p, 23 ref, 18 charts, append. OWRT B-083-WIS(2). 14-31-0001-4138.

Descriptors: *Documentation, *Publications, *Information exchange, Technical writing, Wisconsin, Personnel.
Identifiers: *Wisconsin Department of Natural Resources, *Information transfer.

This study is the second part of the first phase of a more comprehensive research study to examine the transfer of information in the area of water resources. It deals with the physical characteristics, the sources of financial support, publishing sources, format, availability, and subject concentration of the literature (publications) designated to be relevant by a sample of water resources personnel employed by the Wisconsin Department of Natural Resources. Journal title dispersion is described for the applicable literature. Awareness or unawareness of the relevant literature is of primary concern as is a determination of the difference between the known and the unknown literature. (See also W75-07996)

BACK RIVER (MD)
Behavior of Mn, Fe, Cu, Zn, Cd and Pb Discharged from a Wastewater Treatment Plant into an Estuarine Environment,
W75-11160 5B

BACTERIA
Population Dynamics of Protozoa in Wastewater,
W75-10957 5D

Biological Control: Isolation and Bacterial Oxidation of the Taste-and-Odor Compound Geosmin,
W75-11013 5F

BALANCE OF NATURE
An Analysis of the Motor-Row Conversion Issue of Colorado River Float Trips,
W75-10867 6B

BALTIMORE (MD)
Algae in Baltimore's Reservoirs,
W75-11221 5C

BARIUM SULFATE
Acute Toxicity of Petrochemical Drilling Fluids Components and Wastes to Fish,
W75-11265 5C

BARRIER ISLANDS
Matagorda Island, Texas: The Evolution of a Gulf Coast Barrier Complex,
W75-11144 2L

BASALTS
Hydrogeology and Water Resources of Middle Kirkland Creek Basin, Yavapai County, Arizona,
W75-10872 4B

BASE FLOW
Predicting Recessions Through Convolution,
W75-10917 2E

BASIC DATA COLLECTIONS
Temperatures of Kansas Streams,
W75-10933 2E

The Minor and Trace Elements, Gas, and Isotope Compositions of the Principal Hot Springs of Nevada and Oregon,
W75-10937 2K

BEACH EROSION
Beach Erosion Control Structure,
W75-11075 8A

BEANS
The Role of Endogenous Abscisic Acid in the Response of Plants to Stress,
W75-11319 3F

BED LOAD
Measurement of Cobble Abrasion in Natural Streams,
W75-10881 2J

BEDROCK
Contour Map of the Bedrock Surface, New Britain Quadrangle, Connecticut,
W75-10950 7C

Map Showing Depth to Bedrock, Worthington Quadrangle, Massachusetts,
W75-10951 7C

Map Showing Depth to Bedrock, Greenfield Quadrangle, Massachusetts,
W75-10952 7C

Map Showing Depth to Bedrock, Chester Quadrangle, Massachusetts,
W75-10953 7C

Map Showing Depth to Bedrock, Mount Carmel Quandrangle, Connecticut,
W75-10954 7C

BEDROCK SURFACE MAPS
Contour Map of the Bedrock Surface, New Britain Quadrangle, Connecticut,
W75-10950 7C

BEECH
Vegetation, Soil, and Climate on the Green Mountains of Vermont,
W75-11021

BENTHIC FAUNA
Weyl's Theory of Glaciation Supported by Isotopic Study of Norwegian Core K 11,
W75-11153

Seasonal Abundance and Diversity of Benthic in a Southern Illinois, USA Swamp,
W75-11312

BENTHOS
Species Diversity of Benthic Macroinvertebrates and Limnological Conditions in a Order Mountain Stream,
W75-10918

Seasonal Abundance and Diversity of Benthic in a Southern Illinois, USA Swamp,
W75-11312

BIBLIOGRAPHIES
Development of a Bibliographic Information System for Water Yield Improvement Practices,
W75-11050

Computer Systems and Water Resources,
W75-11174

Extraction and Analytical Techniques for Pesticides in Soil, Sediment, and Water,
W75-11236

Non-Renewable, Non-Energy Resources,
W75-11253

The Toxicity of Drilling Fluid Components to Aquatic Biological Systems, A Literature Review,
W75-11266

BIOACCUMULATION
Mercury Contents in Biologically Prescued Specimens of Menuke (Sebastes Barameke and S. Flammeus),
W75-11078

Uptake of Cadmium, Zinc, Copper, Lead and Chromium in the Pacific Oyster, Crassostrea Gigas, Grown in the Tamar River, Tasmania,
W75-11086 5B

Studies on the Inorganic Components of Marine Animals-III, on the Contents of Cadmium, Zinc, Copper, Lead and Iron in Muscle and Viscera of Marine Animals Captured in the West Sea Area of Kyushu, (In Japanese),
W75-11087 5C

IOASSAY
Toxaphene Effects on Growth and Bone Composition of Fathead Minnows, Pimephales Promelas,
W75-11026 5C

Factors Influencing Acute Toxicity Estimates of Hydrogen Sulfide to Freshwater Invertebrates,
W75-11027 5C

Impact of Thermal Effluent from Steam-Electric Station on a Marshland Nursery Area during the Hot Season,
W75-11032 5C

Standard Curves for Nuvacron, Malathion, Sevin, DDT, and Kelthane Tested Against the Mosquito Culex Pipiens L. and the Microcrustacean Daphnia Magna Straus,
W75-11082 5B

Uptake of Cadmium, Zinc, Copper, Lead and Chromium in the Pacific Oyster, Crassostrea Gigas, Grown in the Tamar River, Tasmania,
W75-11086 5B

iomagnification of Dieldrin Residues by Food hain Transfer from Clams to Blue Crabs nder Controllled Conditions,
75-11135 5C

me Effects of Copper on the Polychaete ıyllodoce Maculata,
75-11136 5C

ssipation of Residues of Phenoxy Herbicides plied for Water Milfoil Control in Large servoirs,
75-11198 5B

CHEMICAL OXIDATION
vestigations on the Long Term Biochemical idation of Sewage,
75-11116 5D

HEMICAL OXYGEN DEMAND
estigations on the Long Term Biochemical idation of Sewage,
5-11116 5D

luent Characteristics and Treatment of chanical Pulping Effluents,
5-11331 5D

HEMISTRY
Investigation of Glycolate Excretion in Two cies of Blue-Green Algae,
5-11230 5C

uence of Oil on Nucleic Acids of Algae,
5-11232 5C

HROME ANALYSIS
hrome Analysis as a Method for Assessing oplankton Dynamics, Phase II,
-11052 5C

BIOCONTROL
Biological Control: Isolation and Bacterial Oxidation of the Taste-and-Odor Compound Geosmin,
W75-11013 5F

Comparison of Uredo Eichhorniae, the Waterhyacinth Rust, and Uromyces Pontederiae,
W75-11092 5G

Biological Control of Alligator Weed, 1959-1972,
W75-11202 5G

Biological Control of Eurasian Water Milfoil,
W75-11203 4A

Utilization of Phytopathogens as Biocontrols for Aquatic Weeds,
W75-11206 5G

Water Hyacinth Research in Puerto Rico,
W75-11215 5G

BIODEGRADATION
Biological Control: Isolation and Bacterial Oxidation of the Taste-and-Odor Compound Geosmin,
W75-11013 5F

Measures of Biodegradability and Refractory Organics in Wastewaters: (Analysis, Interpretation, and Application of Measurement Techniques),
W75-11103 5D

Investigations on the Long Term Biochemical Oxidation of Sewage,
W75-11116 5D

Changes in Vegetation and Surface Soil Properties Following Irrigation of Woodlands with Municipal Wastewater,
W75-11243 5B

Biodegradation of Components of Pulp Waste Effluents by Bacteria. (1). Degradation of Kraft Lignin (In Japanese),
W75-11346 5B

BIOINDICATORS
Epifaunal Invertebrates as Indicators of Water Quality in Southern Lake Pontchartain,
W75-10852 5C

Use of Productivity of Periphyton to Estimate Water Quality,
W75-10936 5B

The Use of Snakes as a Pollution Indicator Species,
W75-11089 5B

BIOLOGICAL COMMUNITIES
The Role of Planktonic Protozoa in the Marine Food Chain. Seasonal Changes, Relative Abundance, and Cell Size Distribution of Tintinnida,
W75-11191 5C

BIOLOGICAL TREATMENT
Population Dynamics of Protozoa in Wastewater,
W75-10957 5D

Temperature Effects on Microbial Growth in CSTR's,
W75-10968 5D

Innovative Process Treats Wastewater,
W75-10975 5D

Chemical-Biological Treatment With Biological Filters,
W75-11123 5D

Mill Experience in the Treatment of Mechanical Pulping Effluent,
W75-11332 5D

BIOMASS
Seasonal Variation in Composition, Plant Biomass, and Net Primary Productivity of a Tropical Grassland at Kurukshetra, India,
W75-11006 2I

Seasonal Abundance of Crustacean Zooplankton and Net Plankton Biomass of Lakes Huron, Erie, and Ontario,
W75-11238 5C

BIOMES
Freshwater Ecosystem Research in Water Quality Management,
W75-11012 6G

BIOSPHERE
Mutagens and Potential Mutagens in the Biosphere: II. Metals--Mercury, Lead, Cadmium and Tin,
W75-11171 5B

BIRDS
Oil Pollution and Seabirds in Denmark 1935-1968,
W75-10893 5C

BLACK HILLS (SD)
Watershed Management in the Black Hills: The Status of Our Knowledge,
W75-11318 4D

BLACKFLY
The Effects of Experimental Blackfly (Diptera: Simuliidae) Larviciding with Abate, Dursban, and Methoxychlor on Stream Invertebrates,
W75-11157 5C

BLEACHING WASTES
Evaluation of the Adsorptive Properties of Fly Ash with Reference to a Pulp and Paper Mill Waste Effluent,
W75-11335 5D

BLUE CRAB
Biomagnification of Dieldrin Residues by Food Chain Transfer from Clams to Blue Crabs Under Controllled Conditions,
W75-11135 5C

BOATING
An Analysis of the Motor-Row Conversion Issue of Colorado River Float Trips,
W75-10867 6B

BOGS
Species Diversity of Benthic Macroin-Vertebrates and Limnological Conditions in a 1st Order Mountain Stream,
W75-10918 2I

BOTTOM SEDIMENTS
Application of the Manometric Technique in the Study of Sediment Oxygen Depletion,
W75-11222 5C

BOUNDARIES (SURFACES)
Formulation of Boundary Conditions at the Surface of a Porous Medium,
W75-11269 8B

BOUNDARY CONDITIONS
Formulation of Boundary Conditions at the Surface of a Porous Medium,
W75-11269 8B

BOUNDARY LAYERS
Turbulent Structure Near Smooth Boundary,
W75-11148 8B

BOUNDARY PROCESSES
Application of Electrical Analogy to Draw Flow Nets for Sudden Drawdown Conditions in Earth Dams,
W75-11143 8B

BRACKISH WATER
A Note on Salinity and Temperature in Some Moroccan Brackish Waters,
W75-10997 2L

BRAZIL
Translations on Environmental Quality, No. 33.
W75-11246 5G

BRAZILIAN SNAILS
Water Hyacinth Research in Puerto Rico,
W75-11215 5G

BREAKPOINT CHLORINATION
Nitrogen Removal by Catalyst-Aided Breakpoint Chlorination,
W75-10965 5D

BREAKWATERS
Wave Motion in Rockfill.
W75-10924 8D

BREWING INDUSTRY
Pollution Abatement in a Brewing Facility.
W75-11323 5D

BRITAIN (CONN)
Contour Map of the Bedrock Surface, New Britain Quadrangle, Connecticut,
W75-10950 7C

BRITISH COLUMBIA
Water Resources,
W75-11003 5G

B(ritish) C(olumbia) Presses for Forest Industries Clean-Up.
W75-11350 5G

BROMIDES
Modification of the Iodimetric Titration Method for the Determination of Bromide and Its Application to Mixed Domestic-Industrial Waste Effluents,
W75-11341 5A

BULK CARRIERS
Economics of Great Lakes Shipping in an Extended Season,
W75-11248 6C

BURLINGTON (COLO)
Colorado City Solves Its Sand Pumping Problems,

CANALS
Consolidation and Rehabilitation of Canals in Poudre Valley,
W75-11061 4A

CANNON RIVER WATERSHED (MINN)
Water Resources of the Cannon River Watershed, Southeastern Minnesota,
W75-10948 7C

CAPE ROMANO (FLA)
A Survey of Fishes and Commercial Invertebrates of the Nearshore and Estuarine Zone Between Cape Romano and Cape Sable, Florida,
W75-11189 2

CAPE SABLE (FLA)
A Survey of Fishes and Commercial Invertebrates of the Nearshore and Estuarine Zone Between Cape Romano and Cape Sable, Florida,
W75-11189

CAPITAL COSTS
The Economy of Various Methods for Dewatering Sludge From Biological Purification (Ueber die Wirtschaftlichkeit verschiedener Verfahren zur Entwaesserung von biologischem Klaerschlamm),
W75-11127

CARBON DIOXIDE
Liquid CO2 Protects our Water's Quality,
W75-10990

Dissolved Gases Are Key Corrosion Culprits
W75-11274

CARBON DIOXIDE LASER
CO2 Laser Effects on Water Hyacinth,
W75-11209

CARBON RADIOISOTOPES
Determination of Regional Hydraulic Conductivity Through Use of C-14 Dating of Groundwater,
W75-10930

CARCINOGENS
Stability of Nitrosamines in Samples of Lake Water, Soil, and Sewage,
W75-11019

CARIBBEAN SEA
Near-Bottom Chemistry in the Eastern Pacific and North Atlantic Oceans,
W75-10923

CARTWRIGHT CREEK (TENN)
A Study of Factors Controlling the Chemical Quality of Water in Cartwright Creek Basin, Williamson County, Tennessee,
W75-11164

CASING
Techniques for Linear Tie-Back Cementing
W75-11277

CASINGS
Pitless Adapters: Emphasis on Sanitation.
W75-11258

AVITATION
Predicting Cavitation in Sudden Enlargements,
W75-11151 8B

Cavitation Control by Aeration of High-Velocity Jets,
W75-11152 8B

AYUGA LAKE (NY)
Utilization of Stream-Borne Phosphorus by Cayuga Lake Phytoplankton,
W75-11036 5C

EMENTING
Techniques for Linear Tie-Back Cementing,
W75-11277 8F

EMENTS
Techniques for Linear Tie-Back Cementing,
W75-11277 8F

How BP Alaska Cements Through Permafrost.
W75-11278 8F

How to Make Squeeze Cementing Successful,
W75-11286 8F

Cementing Today's Problem Wells.
W75-11293 8F

NTRIFUGATION
Dewaters Sludge.
W75-10966 5D

ANNEL CATFISH
urvival and Growth Rate of Channel Catfish s a Function of Dissolved-Oxygen Concentra-on,
75-11051 5C

ANNEL EROSION
actors Affecting Erosion in a Semi-Arid atershed,
75-10884 2J

RA
Contribution to the Biology of Nitella ookeri A. BR. in the Rotorua Lakes, New aland. II. Organic Nutrients and Physical ctors,

EURYTEMORA AFFINIS
Adaptation of Copepod Populations to Thermal Stress,
W75-11046 5C

EUTROPHICATION
Wastewater Treatment Using Algae and Artemia,
W75-10967 5D

Preliminary Investigations into Copper Cycling in Indian Lake, Massachusetts: A Lake Treated Annually with Copper Sulfate,
W75-11039 5B

South African Eutrophication Problems: A Perspective,
W75-11131 5C

Dissolved Organic Matter and Lake Metabolism,
W75-11188 5C

Man's Impact on a Newly Formed Reservoir,
W75-11233 5C

The Economic Impact of Pollution Abatement: The Case of Water Pollution by Degradable Organic Matter,
W75-11254 5G

Natural and Fertilizer Nitrogen in Streams and Lakes,
W75-11311 5B

EVALUATION
Waste Water Survey, St. Regis Paper Company, Cantonment, Florida.
W75-11314 5D

EVAPORATION
System for Optimal Pressure Control in a Multi-Stage Evaporation Unit,
W75-11070 3A

The Measurement and Estimation of Lake Evaporation from Four Australian Water Storages,
W75-11300 2D

EVAPORATION CONTROL
Wind Effects on Chemical Films for Evaporation Suppression at Lake Hefner,
W75-10920 3B

EVAPOTRANSPIRATION
Evapotranspiration of Four Forest Types Measured With the Eddy Correlation Technique,
W75-11044 2D

EVAPOTRANSPIRATION CONTROL
An Appraisal of Potential Water Salvage in the Lake McMillen Delta Area, Eddy County, New Mexico,
W75-10941 3B

EVOLUTION
Matagorda Island, Texas: The Evolution of a Gulf Coast Barrier Complex,
W75-11144 2L

EXCRETION
An Investigation of Glycolate Excretion in Two Species of Blue-Green Algae,
W75-11230 5C

EXPLORATION
Making Log Analysts of Geologists.
W75-11288 7C

Subsurface Water -- Tool for Petroleum Exploration,
W75-11289 4B

How Downhole Temperatures, Pressures Affect Drilling; Part 8: Needless Spending of Drilling and Exploration Money Can Be Predicted-And Prevented,
W75-11298 8G

FAILURE (MECHANICS)
The Mechanics of Rock Failure Due to Water Jet Impingement,
W75-11272 8E

FALLOUT
A Field Study of Physico-Chemical States of Artificial Radionuclides in Seawater,
W75-11022 5B

FARM MANAGEMENT
Improving Productivity in Low Rainfall Areas, in India.
W75-11099 3F

FATHEAD MINNOWS
Toxaphene Effects on Growth and Bone Composition of Fathead Minnows, Pimephales Promelas,
W75-11026 5C

FEASIBILITY STUDIES
Tests Show Potassium Mud Versatility,
W75-11284 8G

FEDERAL JURISDICTION
Milestone Water Legislation Accompanied by Millstone of Bureaucratic Red Tape,
W75-11007 5G

FEDERAL WATER POLLUTION CONTROL ACT
Information as a Regulatory Tool in Water Quality Control,
W75-10903 5G

Cost Sharing to Help Clean Our Waterways.
W75-11023 5G

FEHLMANN COLLECTOR
Induced Infiltration Supply System Among Biggest.
W75-11010 5F

FERROALLOYS INDUSTRY
Economic Analysis of Effluent Guidelines. Ferroalloys Industry.
W75-11250 5G

FERTILIZATION
The Effects of Oil Dispersants on the Cell in Fertilization and Development,
W75-11091 5C

Effects of Ozone-Treated Seawater on the Spawned, Fertilized, Meiotic, and Cleaving Eggs of the Commercial American Oyster,
W75-11256 5C

FERTILIZERS
Fertilizer Phosphate in Streams and Lakes,
W75-11310 5B

Natural and Fertilizer Nitrogen in Streams and Lakes,
W75-11311 5B

FILMS
Wind Effects on Chemical Films for Evaporation Suppression at Lake Hefner,
W75-10920 3B

FILTERS
Pilot Plant Study of Denitrification Using a Submerged Sand Filter at Rye Meads Sewage Works,
W75-10955 5D

FILTRATION
Treatment Methods of Groundwater Containing a Large Quantity of Humic Acid (Aufbereitungsversuche an einem stark huminstoffbelasteten Tiefengrundwasser),
W75-11117 5D

Can a Computer Really Operate a Water-Filtration Plant,
W75-11184 5F

Vacuum Distillation/Vapor Filtration Water Recovery,
W75-11315 5D

FINANCING
Upgrading Meat Packing Facilities to Reduce Pollution. (Part 3). Choosing the Optimum Financial Strategy,
W75-11322 5D

FINITE DIFFERENCES
A Three-Dimensional Model for Estuaries and Coastal Seas: Vol. II, Aspects of Computation,
W75-10900 2L

Wave Motion in Rockfill,
W75-10924 8D

FINITE ELEMENT ANALYSIS
Management of Retardation of Salt Water Intrusion in Coastal Aquifers,
W75-11058 2F

Finite-Element Method for Water-Distribution Networks,
W75-11186 4A

FINLAND
Study of Electrochemical Treatment Method for Removing Colloidal Particles from Pulp and Paper Industry Effluents (Tutkimus selluteollisuuden jatevesien kolloidaalisten ainesten poistomahdollisuudesta sahkokemialliesti),
W75-11348 5D

FISH
Studies on Toxicity of Sodium Nifurstyrenate (NFS-NA) in Cultured Yellowtail (In Japanese),
W75-11034 5C

The Toxicity of Drilling Fluid Components to Aquatic Biological Systems, A Literature Review,
W75-11266 5C

Quantitative Estimation of the Daily Ingestion of Phytoplankton by Tilapia Nilotica and Haplochromis Nigripinnis in Lake George, Uganda,
W75-11268 2H

Effluent Characteristics and Treatment of Mechanical Pulping Effluents,
W75-11331 5D

FISH BEHAVIOR
Effect of DDT and M.S. 222 on Learning a Simple Conditioned Response in Rainbow Trout (Salmo gairdneri),
W75-11025 5C

FISH DIETS
Experimentally Increased Fish Stock in the Pond Type Lake Warniak. IV. Feeding of Introduced and Autochthonous Non-Predatory Fish,
W75-11234 5C

FISH DISEASES
Studies on Toxicity of Sodium Nifurstyrenate (NFS-NA) in Cultured Yellowtail (In Japanese),
W75-11034 5C

FISH EGGS
The Effects of Oil Dispersants on the Cell
Fertilization and Development,
W75-11091

Effects of Ozone-Treated Seawater on
Spawned, Fertilized, Meiotic and Cleav
Eggs of the Commercial American Oyster,
W75-11256

FISH MANAGEMENT
Experimentally Increased Fish Stock in
Pond Type Lake Warniak. IV. Feeding of
troduced and Autochthonous Non-Predat
Fish,
W75-11234

FISH PHYSIOLOGY
Effect of DDT and M.S. 222 on Learnin
Simple Conditioned Response in Rainb
Trout (Salmo gairdneri),
W75-11025

Toxaphene Effects on Growth and Bone C
position of Fathead Minnows, Pimeph
Promelas,
W75-11026

Studies on Toxicity of Sodium Nifurstyre
(NFS-NA) in Cultured Yellowtail
Japanese),
W75-11034

The Effects of Oil Dispersants on the C
Fertilization and Development,
W75-11091

FISH POPULATIONS
The Effects of the Formation of Lake K
(Nigeria) Upon the Indigenous Fish Popula
W75-11223

FISH REPRODUCTION
Unisex Studies on the White Amur,
W75-11205

FISH STERILANTS
Unisex Studies on the White Amur,
W75-11205

FISH STOCKING
Experimentally Increased Fish Stock i
Pond Type Lake Warniak. IV. Feeding
troduced and Autochthonous Non-Pre
Fish,
W75-11234

FISHERIES
Limnology of Desert Ponds,
W75-10880

A Survey of Fishes and Commercial
tebrates of the Nearshore and Estuarin
Between Cape Romano and Cape
Florida,
W75-11189

FLOCCULATION
The Mechanism of Flocculation Proce
the Presence of Humic Stubtances,
W75-10958

Process for Treating Industrial Wastes,
W75-11066

Process for Treating Industrial Wastes,

FIC OYSTER
ake of Cadmium, Zinc, Copper, Lead and omium in the Pacific Oyster, Crassostrea as, Grown in the Tamar River, Tasmania,
-11086 5B

E ISLAND
ilization and Reconstruction of Texas stal Foredunes with Vegetation,
-10887 2L

CLE SIZE
hastic Analysis of Particle Movement Over ne Bed,
-10942 2J

Sorting During Suspension Transporta- Lognormality and Other Characteristics,
11162 2J

RE MANAGEMENT
ration of Arid Zone Rainfall and Runoff,
11303 2A

RES
nfluence of Density and Nitrogen on the me of Competition Between Two Annual Pasture Grasses (Hordeum Leporinum Link and Lolium Rigidum Gaud.),
W75-10889 3F

PATENTS
Device for Automatic Determination of Suspended Solids Content in Water,
W75-11063 5A

Process for Treating Sewage Sludge,
W75-11064 5D

System for Softening and Dealkalizing Water by Electrodialysis,
W75-11065 5F

Process for Treating Industrial Wastes,
W75-11066 5D

Process for Treating Industrial Wastes,
W75-11067 5D

Electrolytic Sea Water Process,
W75-11068 3A

Aerobic Lagoon Waste Treatment System and Method,
W75-11069 5D

System for Optimal Pressure Control in a Multi-Stage Evaporation Unit,
W75-11070 3A

Oil Separator with Coalescing Media,
W75-11071 5G

Process for Raw Water Clarification,
W75-11072 5F

Mobile Unit for Treating Liquid Waste,
W75-11073 5D

Low Temperature Water Purification System,
W75-11074 5F

Beach Erosion Control Structure,
W75-11075 8A

Wastewater Treatment Plant,
W75-11076 5D

Flocculation Device for Waste Fluid Treatment,
W75-11077 5D

PATH OF POLLUTANTS
Occurrence of 2, 4, 5-T and Picloram in Surface Runoff Water in the Blacklands of Texas,
W75-10895 5B

Thermal Response of Heated Streams, Solution by the Implicit Method,
W75-10909 5B

Surface Tension Reductions and Urban Wastes in The New York Bight,
W75-10927 5B

Use of Productivity of Periphyton to Estimate Water Quality,
W75-10936 5B

Stability of Nitrosamines in Samples of Lake Water, Soil, and Sewage,
W75-11019 5B

Some Observations on Behavior of the Treated Sewage Disposed in the Sea,
W75-11020 5B

Preliminary Investigations into Copper Cycling in Indian Lake, Massachusetts: A Lake Treated Annually with Copper Sulfate,
W75-11039 5B

Process Studies and Modeling of Self-Cleaning Capacity of Mountain Creeks for Recreation Planning and Management,
W75-11055 5B

The Use of Snakes as a Pollution Indicator Species,
W75-11089 5B

Evidence of Atmospheric Transport of Ozone into Urban Areas,
W75-11169 5A

Solid Wastes, Animal Refuse, and Organic Residues Disposal, and the Quality of Ground Water,
W75-11244 5B

Fertilizer Phosphate in Streams and Lakes,
W75-11310 5B

Natural and Fertilizer Nitrogen in Streams and Lakes,
W75-11311 5B

PATHOGENIC ANOEBIC
Pathogenic Free-Living Amoebae in Arkansas Recreational Waters,
W75-11053 5A

PATHOGENIC BACTERIA
Pathogenic Free-Living Amoebae in Arkansas Recreational Waters,
W75-11053 5A

PEAK DISCHARGE
Flood Runoff from Urban Areas,
W75-10904 5B

PEAK WATER DEMAND
Water Application Practices and Landscape Attributes Associated with Residential Water Consumption,
W75-11059 3D

PENETRATION
'Self-Tapping Screw' Bit Would Use Lighter Weights,
W75-11283 8C

PENNSYLVANIA
Dissipation of Phenoxy Herbicides Applied to Riparian Vegetation,
W75-11214 5B

PERCOLATING WATER
Uranium Mineralization by Ground Water in Sedimentary Rocks, Japan.
W75-11145 2F

PERIPHYTON
Use of Productivity of Periphyton to Estimate Water Quality,
W75-10936 5B

The Growth of Some Epiphytic Algae in a Lake Receiving Thermal Effluent,
W75-11225 5C

PERMAFROST
How BP Alaska Cements Through Permafrost.
W75-11278 8F

PERMITS
Water Conservation in Sweden: III. Current Trends,
W75-10987 5G

PESTICIDE REGISTRATION
Criteria for Herbicide Evaluation,
W75-11196 5G

PESTICIDE RESIDUES
Registration of Herbicides for Aquatic Use, W75-11197 5G

Dissipation of Residues of Phenoxy Herbicides Applied for Water Milfoil Control in Large Reservoirs, W75-11198 5B

Dissipation of Residues of Phenoxy Herbicides Applied to the Watershed, W75-11213 5B

Dissipation of Phenoxy Herbicides Applied to Riparian Vegetation, W75-11214 5B

Extraction and Analytical Techniques for Pesticides in Soil, Sediment, and Water, W75-11236 5A

PESTICIDES
Standard Curves for Nuvacron, Malathion, Sevin, DDT, and Kelthane Tested Against the Mosquito Culex Pipiens L. and the Microcrustacean Daphnia Magna Straus, W75-11082 5B

PHAEOPHYTA
The Accumulation of Cadmium, Copper, Manganese and Zinc by Fucus Vesiculosus in the Bristol Channel, W75-11083 5B

PHENOLOGY
Phenology of Selected Sonoran Desert Plants at Punta Cirio, Sonora, Mexico. W75-10862 2I

PHENOLS
Endemic Nephrophathy and Its Relation to the Contamination of Well Water by Phenolic Compounds in Barsa-Arad (Nefropatia Endemica Si Relatia Cu Impurificarea Prin Compousi Fenolici in Apele Fintinilor Din Comuna Barsa-Arad), W75-11105 5B

Chromatographic Determination of Phenols in Water, W75-11344 5A

PHOSPHATES
Some Observations Concerning Preparation and Storage of Stream Samples for Dissolved Inorganic Phosphate Analysis, W75-11336 5A

Interference of Mercury(II) in the Colorimetric Determination of Inorganic Phosphate in Water, W75-11340 5A

PHOSPHORIC ACID
Use of Amendments to Reduce Water Requirements for Stand Establishment of Small-Seeded Crops, W75-11045 3F

PHOSPHORUS
Utilization of Stream-Borne Phosphorus by Cayuga Lake Phytoplankton, W75-11036 5C

PHOSPHORUS COMPOUNDS
Fertilizer Phosphate in Streams and Lakes, W75-11310 5B

PHOTODIELDRIN
Absorption and Elimination of Photodieldrin by Daphnia and Goldfish, W75-11085 5B

PHREATIC LINES
Application of Electrical Analogy to Draw Flow Nets for Sudden Drawdown Conditions in Earth Dams, W75-11143 8B

PHREATOPHYTES
An Appraisal of Potential Water Salvage in the Lake McMillen Delta Area, Eddy County, New Mexico, W75-10941 3B

PHYLLODOCE MACULATA

# CENTERS OF COMPETENCE AND THEIR SUBJECT COVERAGE

- Ground and surface water hydrology at the Illinois State Water Survey and the Water Resources Division of the U.S. Geological Survey, U.S. Department of the Interior.
- Metropolitan water resources planning and management at the Center for Urban and Regional Studies of University of North Carolina.
- Eastern United States water law at the College of Law of the University of Florida.
- Policy models of water resources systems at the Department of Water Resources Engineering of Cornell University.
- Water resources economics at the Water Resources Center of the University of Wisconsin.
- Eutrophication at the Water Resources Center of the University of Wisconsin.
- Water resources of arid lands at the Office of Arid Lands Studies of the University of Arizona.
- Water well construction technology at the National Water Well Association.
- Water-related aspects of nuclear radiation and safety at the Oak Ridge National Laboratory.
- Water resource aspects of the pulp and paper industry at the Institute of Paper Chemistry.

**Supported by the Environmental Protection Agency in cooperation with WRSIC**

- Effect on water quality of irrigation return flows at the Department of Agricultural Engineering of Colorado State University.
- Agricultural livestock waste at East Central State College, Oklahoma.
- Municipal wastewater treatment technology at the Franklin Institute Research Laboratories.

# SELECTED WATER RESOURCES ABSTRACTS

THE LIBRARY OF THE
DEC 22 1975
UNIVERSITY OF ILLINOIS
AT URBANA-CHAMPAIGN

VOLUME 8, NUMBER 23
DECEMBER 1, 1975

W75-11351 -- W75-11850
CODEN: SWRABW

SELECTED WATER RESOURCES ABSTRACTS is published semimonthly for the Water Resources Scientific Information Center (WRSIC) by the National Technical Information Service (NTIS), U.S. Department of Commerce. NTIS was established September 2, 1970, as a new primary operating unit under the Assistant Secretary of Commerce for Science and Technology to improve public access to the many products and services of the Department. Information services for Federal scientific and technical report literature previously provided by the Clearinghouse for Federal Scientific and Technical Information are now provided by NTIS.

SELECTED WATER RESOURCES ABSTRACTS is available to Federal agencies, contractors, or grantees in water resources upon request to: Manager, Water Resources Scientific Information Center, Office of Water Research and Technology, U.S. Department of the Interior, Washington, D. C. 20240.

SELECTED WATER RESOURCES ABSTRACTS is also available on subscription from the National Technical Information Service. Annual subscription rates are: To the SWRA Journal, $75 ($95 foreign); to the Journal & Annual Index, $100 ($125 foreign); to the Annual Index only, $50 ($65 foreign). Certain documents abstracted in this journal can be purchased from the NTIS at prices indicated in the entry. Prepayment is required.

# SELECTED
# WATER RESOURCES ABSTRACTS

A Semimonthly Publication of the Water Resources Scientific Information Center,
Office of Water Research and Technology, U.S. Department of the Interior

**VOLUME 8, NUMBER 23**
DECEMBER 1, 1975

W75-11351 -- W75-11850

The Secretary of the U. S. Department of the Interior has determined that the publication of this periodical is necessary in the transaction of the public business required by law of this Department. Use of funds for printing this periodical has been approved by the Director of the Office of Management and Budget through August 31, 1978.

As the Nation's principal conservation agency, the Department of the Interior has responsibility for most of our nationally owned public lands and natural resources. This includes fostering the wisest use of our land and water resources, protecting our fish and wildlife, preserving the environmental and cultural values of our national parks and historical places, and providing for the enjoyment of life through outdoor recreation. The Department assesses our energy and mineral resources and works to assure that their development is in the best interests of all our people. The Department also has a major responsibility for American Indian reservation communities and for people who live in Island Territories under U.S. administration.

# FOREWORD

**Selected Water Resources Abstracts,** a semimonthly journal, includes abstracts of current and earlier pertinent monographs, journal articles, reports, and other publication formats. The contents of these documents cover the water-related aspects of the life, physical, and social sciences as well as related engineering and legal aspects of the characteristics, conservation, control, use, or management of water. Each abstract includes a full bibliographical citation and a set of descriptors or identifiers which are listed in the **Water Resources Thesaurus.** Each abstract entry is classified into ten fields and sixty groups similar to the water resources research categories established by the Committee on Water Resources Research of the Federal Council for Science and Technology.

WRSIC IS NOT PRESENTLY IN A POSITION TO PROVIDE COPIES OF DOCUMENTS ABSTRACTED IN THIS JOURNAL. Sufficient bibliographic information is given to enable readers to order the desired documents from local libraries or other sources.

**Selected Water Resources Abstracts** is designed to serve the scientific and technical information needs of scientists, engineers, and managers as one of several planned services of the Water Resources Scientific Information Center (WRSIC). The Center was established by the Secretary of the Interior and has been designated by the Federal Council for Science and Technology to serve the water resources community by improving the communication of water-related research results. The Center is pursuing this objective by coordinating and supplementing the existing scientific and technical information activities associated with active research and investigation program in water resources.

To provide WRSIC with input, selected organizations with active water resources research programs are supported as "centers of competence" responsible for selecting, abstracting, and indexing from the current and earlier pertinent literature in specified subject areas.

Additional "centers of competence" have been established in cooperation with the Environmental Protection Agency. A directory of the Centers appears on inside back cover.

Supplementary documentation is being secured from established discipline-oriented abstracting and indexing services. Currently an arrangement is in effect whereby the BioScience Information Service of Biological Abstracts supplies WRSIC with relevant references from the several subject areas of interest to our users. In addition to Biological Abstracts, references are acquired from Bioresearch Index which are without abstracts and therefore also appear abstractless in SWRA. Similar arrangements with other producers of abstracts are contemplated as planned augmentation of the information base.

The input from these Centers, and from the 51 Water Resources Research Institutes administered under the Water Resources Research Act of 1964, as well as input from the grantees and contractors of the Office of Water Research and Technology and other Federal water resource agencies with which the

Center has agreements becomes the information base from which this journal is, and other information services will be, derived; these services include bibliographies, specialized indexes, literature searches, and state-of-the-art reviews.

Comments and suggestions concerning the contents and arrangements of this bulletin are welcome.

## CONTENTS

FOREWORD_____iii

SUBJECT FIELDS AND GROUPS

(Use Edge Index on back cover to Locate Subject Fields and Indexes in the journal.)

**01** NATURE OF WATER
Includes the following Groups: Properties; Aqueous Solutions and Suspensions

**02** WATER CYCLE
Includes the following Groups: General; Precipitation; Snow, Ice, and Frost; Evaporation and Transpiration; Streamflow and Runoff; Groundwater; Water in Soils; Lakes; Water in Plants; Erosion and Sedimentation; Chemical Processes; Estuaries.

**03** WATER SUPPLY AUGMENTATION AND CONSERVATION
Includes the following Groups: Saline Water Conversion; Water Yield Improvement; Use of Water of Impaired Quality; Conservation in Domestic and Municipal Use; Conservation in Industry; Conservation in Agriculture.

**04** WATER QUANTITY MANAGEMENT AND CONTROL
Includes the following Groups: Control of Water on the Surface; Groundwater Management; Effects on Water of Man's Non-Water Activities; Watershed Protection.

**05** WATER QUALITY MANAGEMENT AND PROTECTION
Includes the following Groups: Identification of Pollutants; Sources of Pollution; Effects of Pollution; Waste Treatment Processes; Ultimate Disposal of Wastes; Water Treatment and Quality Alteration; Water Quality Control.

**06** WATER RESOURCES PLANNING
Includes the following Groups: Techniques of Planning; Evaluation Process; Cost Allocation, Cost Sharing, Pricing/Repayment; Water Demand; Water Law and Institutions; Nonstructural Alternatives; Ecologic Impact of Water Development.

**07** RESOURCES DATA
Includes the following Groups: Network Design; Data Acquisition; Evaluation, Processing and Publication.

**08** ENGINEERING WORKS
Includes the following Groups: Structures; Hydraulics; Hydraulic Machinery; Soil Mechanics; Rock Mechanics and Geology; Concrete; Materials; Rapid Excavation; Fisheries Engineering.

**09** MANPOWER, GRANTS, AND FACILITIES
Includes the following Groups: Education—Extramural; Education - In-House; Research Facilities; Grants, Contracts, and Research Act Allotments.

**10** SCIENTIFIC AND TECHNICAL INFORMATION
Includes the following Groups: Acquisition and Processing; Reference and Retrieval; Secondary Publication and Distribution; Specialized Information Center Services; Translations; Preparation of Reviews.

**COMPARATIVE ANALYSIS OF ESTIMATION METHODS IN NONLINEAR FUNCTIONAL MODELS OF THE RAINFALL-RUNOFF PROCESS,**
Purdue Univ., Lafayette, Ind. Water Resources Research Center.
V. R. Rao, and R. G. S. Rao.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-244 147, $5.25 in paper copy, $2.25 in microfiche. Technical Report No 56, December 1974. 107 p, 17 fig, 13 tab, 36 ref, append. OWRT B-025-IND(5).

Descriptors: *Rainfall-runoff relationships, *Mathematical models, *Urban runoff, Drainage, Unit hydrographs, Hydrograph analysis, Model studies, *Indiana, Simulation analysis, Estimating.
Identifiers: *Nonlinear models, *Kernel functions.

The methods of estimation of kernel functions of nonlinear functional models proposed by Brandstetter and Amorocho, Boneh and Diskin, Bidwell, and Roy and Sherman are compared. The rainfall-runoff data from an urban (Ross Ade) watershed in West Lafayette, Indiana were used in the study. The computational complexity, the performance of the estimated kernels in both the regeneration and prediction modes were used for comparing the different methods of estimation of kernal functions. The analysis was conducted to select a method which can be easily used and which is also accurate. The method of kernel function estimation by Brandstetter and Amorocho was selected as the most desirable method on the basis of computational ease, flexibility and accuracy. The second objective was to demonstrate the utility of nonlinear functional series models in simulating the short time increment runoff process. The nonlinear functional models can be used for simulation of runoff provided the kernel functions of these models are accurately estimated.

**STORM TIDE FREQUENCY ANALYSIS FOR THE COAST OF PUERTO RICO,**
National Weather Service, Silver Spring, Md. Office of Hydrology.
F. P. Ho.
Available from National Technical Information Service, U.S. Department of Commerce, Sills Building, 5285 Port Royal Road, Springfield, Va 22161. NOAA Technical Memorandum NWS HYDRO-23, May 1975. 43 p.

Descriptors: *Wind tides, *Storm surge, *Computer models, *Coasts, Tides, Storms, Hurricanes, Hydrodynamics, Winds, Oceanography, Climatology.
Identifiers: *Puerto Rico coast, Storm height frequency distributions, National Flood Insurance Program, Tide levels, Coastal floods.

Storm tide height frequency distributions on the coast of Puerto Rico are developed for the National Flood Insurance Program by computing storm tides from a full set of climatologically representative hurricanes, using the National Weather Service hydrodynamic storm surge model adapted to local conditions. Hurricane parameters are analyzed and presented. Tide levels for the southern coast of Puerto Rico are shown in coastal profile between annual frequencies of 0.10 and .002. Similar tide levels for San Juan on the northern coast and Mayaguez on the western coast are also presented, and tentative interpolated tide levels of .01 annual frequency for the remaining coasts. Wave effects on the north coast are discussed. (NOAA)

**THE VALUE OF THE PEAK RUNOFF COEFFICIENT PSIS (UEBER DEN AUSSAGEWERT DES SPITZENABFLUSSBEIWERTES PSIS),**
J. Keser.
Gas-und Wasserfach-Wasser/Abwasser, Vol 116, No 1, p 17-19, 1975. 4 fig, 6 ref.

Descriptors: *Rainfall-runoff relationships, *Rainfall intensity, Topography, Runoff coefficient, Precipitation(Atmospheric), Mathematical studies, Model studies.

The value and relevance of using the peak runoff coefficient, a ratio of the peak runoff yield to the peak rain yield, is discussed. The peak runoff coefficient indicates that a certain duration of the peak rainfall yield is necessary to generate an increase in the runoff. The peak runoff coefficient is predominantly influenced by precipitation and topographical characteristics; these describes the distribution of the runoff over time. The dependence of the peak runoff coefficient on the rainfall characteristics is influenced by the terrain but it is not conditioned by the precipitation. The peak runoff coefficient is determined from the transfer function that is characteristic for the terrain, and is constant even for prolonged rainfall events. The total runoff coefficient must be consistently greater than the peak runoff coefficient. (Takacs-FIRL)
W75-11713

**MAN ON THE HYDROLOGIC CYCLE,**
Annamalai Univ., Annamalainagar (India).
K. Achuthan.
Water Resources Bulletin, American Water Resources Association, Vol 10, No 4, p 756-758, August 1974. 2 ref.

Descriptors: *Hydrologic cycle, Precipitation, Evaporation, Storage, Conservation, Water utilization, Water balance, Environment.

Man is the one biological factor that can either make environment fit his needs or unknowingly ruin it. The major phases of the hydrologic cycle in which man interfere are: precipitation, storage, and evaporation. A change in any one phase will generally cause modification to the other phases of the cycle: the only certainty is that the water balance will indeed balance. Through conservation practices and careful management and through critical study of cause and effect, the hydrologist can be influential in raising living standards and making his country self-supporting and prosperous. **HYDROLOGIC ASPECTS OF WATER HARVESTING IN THE NORTHERN GREAT PLAINS,**
Agricultural Research Service, Boise, Idaho. Northwest Watershed Research Center.
C. L. Hanson, E. L. Neff, and D. A. Woolhiser.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, U.S. Department of Agriculture, Agricultural Research Service, Berkeley, California, Western Region, p 129-140, 9 fig, 3 tab, 7 ref.

Descriptors: *Water harvesting, *Water supply, *Watersheds(Basins), *Water storage, *Rainfall-runoff relationships, *Simulation analysis, Semiarid climates, Stock water, Streaflow, Water tanks, Flow Drainage systems, South Dakota, Runoff, Rainfall, Seepage, Reservoirs, Ponds, Simulated rainfall, Systems analysis, Computer models, Mathematical models, Markov processes, Stochastic processes, *Great Plains.
Identifiers: Northern great plains, Runoff farming.

The systems approach for simulating storage of water in ponds is based on hydrologic information, contributing area, number of cattle, length of grazing season, seepage estimates, and evaporation rates, and has three essential steps: system description, selection of an objective function, and optimization. Daily rainfall can be simulated, using a stochastic model. Pond simulation using an example watershed was done to test this model. The Markov chain-exponential model described daily precipitation, and either of the two stochastic models, exponential or beta, described the relationship between daily precipitation and runoff. Seepage loss was the most difficult to describe. (See also W75-11800) (Robinett-Arizona)
W75-11811

## 2B. Precipitation

**THE RAINFALL RECORDER PROBLEM,**
Birmingham Univ. (England). Dept. of Civil Engineering.
P. S. Kelway.
Journal of Hydrology, Vol 26, No 1/2, p 55-77, July 1975. 3 fig, 6 tab, 20 ref.

Descriptors: *Rainfall, *Radar, *Precipitation gages, *Rain gages, Networks, Computer programs, Sampling, Instrumentation, Time, Charts, Quality control, Data collections.
Identifiers: *Rain recorders, Errors, *Error detection, *England, *Wales, Fault reduction.

Comparison of areal rainfall estimates derived from Radar measurements and ground-based recording rain gages was initiated at the University of Birmingham. To obtain data for various storms to be analyzed during the project, it was necessary to set up a system to collate and process information from rainfall recorders over England and Wales. Three major groups of difficulties were apparent: (1) collation of available data; (2) the wide variety of recorder types and numerous sources of error associated with them, and (3) the difficulty of abstracting data from the recording media. It was not easy to obtain recording gage data due to the number of different authorities that had to be approached. A computer-based schedule, with annotated details with any gage or site shortcomings, was compiled of all recording gages using the Meteorological Office information as a basis. The most common gages found were the weighing gage, the tilting-syphon gage, natural-syphon gage, hyeotgraph, and rate-of-rainfall recorder. Most instrumental errors were found to occur through a lack of effective maintenance. Trouble occurred from the ingress of foreign matter into joints which should be sealed. Most pen faults could have been prevented by use of glass recording pens and plasticized charts or pressure-sensitive chart recorders. The project showed the need for a central collection agency and a comprehensive system of data processing. (Roberts-ISWS)
W75-11448

**COMPARISON OF PRECIPITATION GAGE CATCHES WITH A MODIFIED ALTER AND A RIGID ALTER TYPE WINDSHIELD,**
Agricultural Research Service, Boise, Idaho. Northwest Watershed Research Center.
W. J. Rawls, D. C. Robertson, J. F. Zuzel, and W. R. Hamon.
Water Resources Research, Vol 11, No 3, p 415-417, June 1975. 1 fig, 2 tab, 6 ref.

Descriptors: *Precipitation gages, *Storms, *Idaho, Wind velocity, Eddies, Rain, Linear programming, Temperature, Regression analysis, Snowfall, Rain gages, Climatology, Climatic data.
Identifiers: *Alter windshield, *Gage catch, Hamon dual gage.

Precipitation gage catch from two Belfort Model 5-780 standard weighing recording rain gages, one with a modified Alter Windshield and one with a rigid Alter type windshield, were compared for 89 storms with wind speeds ranging from 4 to 32 mph and temperatures ranging from 14 to 69 degrees F. The differences between gage catches were statistically significant at the 1% level for wind speeds of 12 to 16 mph and for temperatures of 23 degrees F. Since on the average the windshields do not produce significantly different catches, either windshields can be used to compute actual precipitation by using the Hamon dual gage approach. (Roberts-ISWS)

**A FEDERAL PLAN FOR NATURAL DISASTER WARNING AND PREPAREDNESS, FIRST SUPPLEMENT FY 1976 - 1980.**
National Oceanic and Atmospheric Administration, Washington, D.C.
Available from Superintendent of Documents, U.S. Government Printing Office, Washington, DC 20402, for $1.75. June 1975. 101 p.

Descriptors: *Warning systems, *Storms, *Disasters, *Climatic data, *Weather forecasting, *Weather modification, Damages, Safety, Earthquakes, Floods, Tornadoes, Volcanoes, Landslides, Avalanches, Hurricanes, Droughts, Ice, Meteorology, Snow, Weather, Tsunamis, Forecasting.
Identifiers: *Natural disasters warning, Federal plans, Natural hazards, Storm warnings.

The Federal Plan for Natural Disaster Warning and Preparedness, June 1973, presented the Federal action programs and plans for fiscal years 1973 - 78 to satisfy the unmet needs in the existing natural disaster warning system and community preparedness programs. This first supplement to the Plan examines the recent performance of the disaster warning system, reports the progress made toward improving the warning system and community preparedness program, and updates the action plans of the ten participating Federal agencies for fiscal years 1975 - 80 to satisfy identified needs. (NOAA)

Meteorology, Charts, Weather data, Data col
tions, Probability, Climatological data.
Identifiers: *Hurricane factors, *Climatolog
characteristics, Landfalling hurricanes,
coast(US), East coast(US), Smoothed freq
cies

A climatology of hurricane factors importar
storm surges is presented for the U.S. gulf and
coasts. A smoothed frequency of tropical st
and hurricanes entering and exiting the coast
storms passing within 150 nautical miles of
coast during the period 1871-1973 is given.
central pressure for hurricanes and tropical st
and the radius of maximum winds and spe
forward motion for hurricanes were obtained
data analysis. Directions of landfalling hurric
and tropical storms at the time they crosse
coast at selected points were also analyzed.
probability distribution of each factor is pl
and analyzed for each 50-n.mi. interval alon
coast. Selected probability levels of each dis
tion are then summarized, and smoothed
tions along the coast are obtained by analysis
speeds of motion for two classes of hurri
(those that entered the coast and those that p
within 150 n.mi. of the coast) are studied sep
ly and a smooth speed analysis is determine
each. The question of joint probability amon
various factors and with latitude is disc
qualitatively. (NOAA)

tions.

While there is no question that release o
heat of condensation is a major factor in
mature hurricanes, uncertainty has re
about its role in hurricane formation and th
of large intensity increases sometimes expe
by a hurricane which had persisted o
plateau for several days. It has previous
hypothesized by the author that hurrican
intensification is often related to a one to
prior increase of upper tropospheric baro
500-1000 km around the pre-cyclone distu
This prior increase of upper level baroclin
usually associated with a traveling middle
westerly cyclone. A number of recent yea
ples in the West Indies are presented. (NO

ATELLITE CLASSIFICATION TECHNIQUE R SUBTROPICAL CYCLONES,
ional Weather Service, Fort Worth, Tex. thern Region.
. Hebert, and K. O. Poteat.
AA Technical Memorandum NWS SR-83, July 5. 6 fig, 7 tab, 8 ref.

criptors: *Tropical cyclones, *Cyclones, tellites(Artificial), *Weather forecasting, ather, Weather patterns, Subtropic, Storms, ricanes, Meteorology, Meteorological data, ds, *Remote sensing.
ntifiers: Satellite pictures, *Subtropical ones, *Cyclone types, Weather satellites, lone intensity, Dvorak technique.

Dvorak (1973) technique for estimating the in- ity of tropical (T) cyclones from satellite pic- s is frequently inapplicable for subtropical cyclones. A new technique which gives not the intensity but also the type (tropical, sub- ical) of cyclone has been derived, using elines similar to the Dvorak scheme, so that two systems will intermesh when cyclones ge type. These guidelines were evaluated by ni Satellite Field Services Station (SFSS) orologists for a data sample of 32 cases (27 ropical) for the period May-November 1968- Results indicate mean absolute wind errors parable to those using the Dvorak technique, well as a successful meshing of the two niques, and the ability to distinguish between wo types of cyclones. **TROPICAL CYCLONE INTENSITY ANALYSIS AND FORECASTING FROM SATELLITE IMAGERY,**
National Environmental Satellite Service, Washington, D.C.
V. F. Dvorak.
Mariners Weather Log, Vol 19, No 4, p 199-206, July 1975. 5 fig, 5 ref.

Descriptors: *Tropical cyclones, *Weather forecasting, *Satellites(Artificial), *Remote sensing, Analysis, Climatological data, Meteorology, Climatology.
Identifiers: *Tropical cyclone intensity, *Satellite imagery, Cloud characteristics, Modeled curve, Intensity forecast, Intensification process.

This report describes a systematic procedure for estimating tropical cyclone intensities using imagery from meteorological satellites. Two sets of cloud characteristics are analyzed, with guidance from a model of tropical cyclone change derived empirically from satellite data. One set of characteristics is used to estimate cyclone intensity. It is made up of three parameters: the central features which define the cloud system center and its relation to dense-overcast clouds; the outer banding features which curve around the central features; and the vertical depth of the clouds comprising these features. Intensity is considered to be related to the sum of the three parameters. The assessment of intensity is made in three stages. The first yields a modeled estimate of the cyclone's intensity; the second and third use the cloud pattern and feature measurements to verify or adjust the modeled expectation. The second set of cloud features is then analyzed to determine if an extrapolation along the cyclone's particular modeled curve is to be used for the 24-hour intensity forecast. These features are related to the intensification process within the cyclone and to environmental changes that may affect the cyclone during the forecast period. (NOAA)

**WESTERN NORTH PACIFIC TYPHOONS, 1974,**
Fleet Weather Central FPO San Francisco, 96630.
C. R. Holliday.
Mariners Weather Log, Vol 19, No 4, p 207-224, July 1975. 25 fig, 4 tab.

Descriptors: *Typhoons, *Climatological data, *Synoptic analysis, Tropical cyclones, Climatology, Meteorology, Storms, Monsoons, Documentation, Weather data, *Pacific Ocean.
Identifiers: West north Pacific, *Tropical cyclone activity, Supertyphoons, Typhoon days, Philippine Islands, Monsoon westerlies.

There was a sharp reversal, during 1974, from the abnormally light tropical cyclone activity observed during 1973. Named tropical cyclones numbered 32, 10 percent higher than the latest 15-year average. The number of typhoon days, however, numbered only 62, well below the 15-year average of 90 days, reflecting a tendency of this season's tropical cyclones not to develop beyond storm strength. No supertyphoons were observed during 1974, the first such occurrence since documentation began in 1959. One of the unusual synoptic features during August and September was the penetration of monsoon westerlies to more poleward latitudes than normal. By early October, however, the monsoon through became reestablished near its normal position in the Philippine Sea, and triggered development of a series of destructive cyclones that crossed the Philippine Islands. The frequency of repeated onslaughts to the island of Luzon is unparalleled in climatological records available since World War II. (NOAA)

**CELLULAR SNOW GENERATION--A DOPPLER RADAR STUDY,**
Chicago Univ., Ill. Lab. for Atmospheric Probing.
R. E. Carbone, and A. R. Bohne.
Journal of the Atmospheric Sciences, Vol 32, No 7, p 1384-1394, July 1975. 5 fig, 1 tab, 16 ref, append. ONR N00014-67A-0285-0014, NSF GA-38109.

Descriptors: *Snow, *Radar, *Cloud physics, Convection, Measurement, Crystals, Snowfall, Precipitation(Atmospheric), Velocity, Air circulation, Meteorology.
Identifiers: *Doppler radar, Doppler velocity spectra, Reflectivity, Updrafts.

Snow generating cells were observed by vertically pointing Doppler radar. Analysis was carried out in three distinct regions. The region exhibiting cellular structure was found to consist of convective elements with vertical velocities + or -1.5 m/s in magnitude. A generation region was found to exist beneath the convective region with updrafts of 0.5 m/s sustained over a 7 km path length which originated at a generating level less than 75 m in depth associated with an inversion layer. The trail region below exhibited maximum downdrafts of 0.5 m/s or no net vertical motions. Maximum ice content was estimated to be no larger than 0.24 g/cu m in the convective cells. Growth appeared to take place throughout the rise and fall of the snow crystals in the updraft regions. (Sims-ISWS)

**TROPICAL SHOWERS IN AN AXISYMMETRIC CLOUD MODEL,**
Hawaii Univ., Hilo. Cloud Physics Observatory.
T. Takahashi.
Journal of the Atmospheric Sciences, Vol 32, No 7, p 1318-1330, July 1975. 20 fig, 34 ref. ONR 014-67A-0387-0015, NSF GA-40124.

Descriptors: *Model studies, *Cloud physics, *Rainfall, *Hawaii, Precipitation(Atmospheric), Rainfall intensity, Raindrops, Mathematical models, Computer models, Condensation, Evaporation, Rain, Clouds, Meteorology.
Identifiers: *Cloud models, Warm rains, Tropical showers, Cumulus clouds, Raindrop size.

Tropical showers from warm cumulus-type clouds were studied numerically in an axisymmetric cloud model. Drop sizes were classified into 61 groups and condensation (evaporation), collection, and breakup processes were introduced. The distinctive character of such showers--heavy, short-lived, and localized in nature, without any strong wind speed change near the ground--was simulated successfully. Because of the weak inflow, raindrop size distribution was primarily determined by the vertical trajectory of drops. The calculated

raindrop size distribution agreed relatively well with the Marshall-Palmer size distribution curve. A one-dimensional cylindrical cloud model was also compared with the present symmetric cloud model, and it was found that both rainfall and the life cycle for deep clouds were difficult to stimulate by a simple one-dimensional model. It was also found that the disturbance area due to the cumulus-type cloud is more localized than in the stratocumulus-type cloud. (Sims-ISWS)

**AN ACCELERATION SYSTEM FOR WATER DROPS,**
Toronto Univ. (Ontario). Dept. of Physics.
J. D. McTaggart-Cowan, and R. List.
Journal of the Atmospheric Sciences, Vol 32, No 7, p 1395-1400, July 1975. 6 fig, 12 ref.

Descriptors: *Laboratory equipment, *Cloud physics, *Drops(Fluids), Instrumentation, Equipment, Raindrops, Simulated rainfall, Meteorology, Laboratory tests.
Identifiers: *Raindrop simulation, Acceleration systems, Drop fall velocity.

Linear accelerator systems were described which allow the production of series of homogeneously sized water drops of different diameter and at terminal velocity, with small oscillations, negligible charges, and in air of low turbulence intensity. Combinations of parallel systems and blowers displacing the smaller drops into the path of the larger ones allowed the study of collision and breakup under conditions which essentially duplicate nature. the chances to observe interactions were considerably enhanced by opto-electronic selection devices. (Sims-ISWS)

**COLLISION AND BREAKUP OF WATER DROPS AT TERMINAL VELOCITY,**
Toronto Univ. (Ontario). Dept. of Physics.
J. D. McTaggart-Cowan, and R. List.
Journal of the Atmospheric Sciences, Vol 32, No 7, p 1401-1411, July 1975. 11 fig, 1 tab, 36 ref.

Descriptors: *Cloud physics, *Laboratory tests, *Raindrops, Drops(Fluids), Particle size, Rain, Coalescence, Precipitation(Atmospheric), Meteorology.
Identifiers: *Drop collisions, *Drop breakup.

The collision and subsequent breakup of water drops moving essentially vertically and at terminal velocity has been studied for 5 drop pairs. The diameters of the large drops were 4.8, 3.6, and 3.0 mm; the diameters of the small drops were 1.8 mm and 1.0 mm. 712 collisions were obtained in 25,000 individually recorded attempts. Three distinct types of collision-breakup were found with the following occurrence: necks 27%, sheets 55%, and disks 18%. Bag breakups were insignificant at less than 0.5%. All types are defined and corresponding examples shown. Fragment size and number distributions for the different types and the overall situation gave further reasons for the breakdown into the different types. The disk collision has been found to be the major cause for the depletion in number of large drops, hence the cutoff of large drops in rain. The results also form the first data bank for numerically modelling the evolution of raindrop size spectra and the Langmuir chain process. (Sims-ISWS)

**COLLISION EFFICIENCY OF WATER DROPS IN THE ATMOSPHERE,**
Missouri Univ., Rolla. Dept. of Mechanical and Aerospace Engineering.
C. L. Lin, and S. C. Lee.
Journal of the Atmospheric Sciences, Vol 32, No 7, p 1412-1418, July 1975. 8 fig, 26 ref, 1 append.
ONR N00014-69A-0141-0006.

Descriptors: *Coalescence, *Raindrops, *Cloud physics, Drops(Fluids), Mathematical models, Model studies, Meteorology, Precipitation(Atmospheric), Rainfall.
Identifiers: *Collision efficiency, Drop collisions

A study has been made of the growth of water drops through collision in the atmosphere. The method of superposition of flow fields obtained from the numerical solution of the Navier-Stokes equations was used for the calculations, and only inertia, gravity, and drag force were considered. The calculated linear collision efficiency is significantly less than the geometric collision efficiency between a large collector drop and a small collecting drop because of the effect of hydrodynamic forces. The linear collision efficiency is substantially higher than the geometric collision efficiency between similarly sized drops because of the wake effect. To verify the validity of the calculations, the analytical results were compared with available experimental data. Satisfactory agreement was obtained for most drop sizes. It is concluded that in the absence of electricity and turbulence the dominant factor in the formation of precipitation is the collisional growth of similarly sized drops. (Sims-ISWS)

**ON THE COLLECTION EFFICIENCY OF WATER DROPLETS UNDER THE INFLUENCE OF ELECTRIC FORCES, I: EXPERIMENTAL, CHARGE-MULTIPOLE EFFECTS,**
Hebrew Univ., Jerusalem (Israel). Dept. of Atmospheric Sciences.
N. Dayan, and I. Gallily.
Journal of the Atmospheric Sciences, Vol 32, No 7, p 1419-1429, July 1975. 10 fig, 36 ref, 3 append.

Descriptors: *Cloud physics, *Drops(Fluids), *Electrical properties, Aerosols, Laboratory tests, Precipitation(Atmospheric), Meteorology.
Identifiers: *Collection efficiency, *Electric forces, Electric charge, Drop collisions, Drop growth.

The collection efficiency of water droplets under the influence of electric forces was studied in simulation experiments for the case of a charge-induced multipole interaction. With the aid of an elaborate laboratory apparatus, the size increase of a charged droplet falling through a cloud of neutral, almost uniform small particles was determined, and an average collection efficiency deduced. The experimental results indicated efficiencies of one or two orders of magnitude greater than the values for neutral droplets under otherwise similar conditions. The efficiences were also found to increase with the ratio of collected to collecting droplet sizes and were insensitive to variations of the electric charge of the particles. (Sims-ISWS)

urnal of Hydrology, Vol 26, No 1/2, p 79-94, ly 1975. 5 fig, 4 tab, 7 ref.

scriptors: *Evapotranspiration, *Soil moisture, riculture, *Mathematical models, Pasture nagement, Crops, Precipitation(Atmospheric), noff, Albedo, Regime, Infiltration rates, atersheds(Basins).
ntifiers: *Upland grass catchments, *Pennines, sture catchments, Potential evapotranspiration, nman's method, Soil moisture model, drologic regime, Infiltration capacity.

thematical models were used to investigate the an moisture states and the actual evapotrans- ation from two small pasture catchments in the tern Pennines. Both precipitation and runoff re measured and potential evapotranspiration culated by Penman's method. The only unk- wns were actual evapotranspiration and soil isture, and these were estimated using a two- ge soil moisture model. It was found that the chment covered by typical Pennine rough graz- had an available soil moisture content of about mm and an albedo of 0.18, both lower than the ues for improved pasture. The rough grazing ame quickly saturated after rain and rapidly in summer. It was found on both rough grazing improved pasture with light or moderate rain- amounts that the amount of runoff was con- led by the soil-moisture state and not by the in- ation capacity of the soil. With heavy rainfalls siderable runoff occurred while the soil at th remained moderately dry. (Roberts-ISWS)

**DEMODULATION OF STREAM-FLOW SERIES,**
Bristol Univ. (England). Dept. of Geography.
M. G. Anderson.
Journal of Hydrology, Vol 26, No 1/2, p 115-121, July 1975. 4 fig, 1 tab, 11 ref.

Descriptors: *Fourier analysis, *Frequency, *Time series analysis, *Streamflow, *Methodology, Analytical techniques, Stochastic processes, Mathematics, Rainfall, Precipitation(Atmospheric), Model studies, Discharge(Water).
Identifiers: *Demodulation techniques, *River Blythe(England), Deterministic component.

Demodulation techniques enable changes in the amplitude and phase for a given frequency to be determined. In fitting two component models to hydrologic variables when one component is deterministic (oscillatory) and the other is stochastic, there is a danger of incorrectly assigning the two components should the amplitude of a given frequency of the deterministic component change with time. Two filters of different length are used in demodulation techniques. These techniques have been demonstrated to be a powerful method for identifying changes in the amplitude of an oscillation of a given frequency within precipitation and discharge time-series. As an example, the construction of a dam was verified by analysis of the annual discharge for the river Blythe. (Singh-ISWS)

Identifiers: *Ekman layers.

The steady circulation of a homogeneous ocean was investigated in the region where the bottom rises to meet the surface at the coast as over a continental shelf. In this region the bottom Ekman layer becomes important and carries the coastal upwelling from the shelf interior region to the surface Ekman layer. A strong longshore current is produced in the shelf boundary layer and, for certain distributions of wind stress, an offshore deep counter-current is formed. At a given latitude the longshore flow near the coast depends on the local wind, whereas the offshore counter-current and the net northwards transport in the shelf layer are a function of the latitudinal distribution of wind stress. East-Central State Soil and Water Resources (Nigeria).
C. G. Ilo.
Journal of the Hydraulics Division, Proceedings of American Society of Civil Engineers, Vol 101, No HY6, Proceedings Paper 11352, p 665-679, June 1975. 3 fig, 6 tab, 18 ref, 3 append.

Descriptors: *Alluvial channels, *Flow, *Resistance, *Laboratory tests, *Flumes, Hydraulic models, Hydraulics, Flow characteristics, Open channels, Channels, Streambeds, Beds, River beds, Friction, Shear, Roughness(Hydraulic), Darcy-Weisbach equation, Graded, Regime, Canals, Channel morphology, Canal design, Rivers, Discharge measurement.
Identifiers: *Bed forms, Kinematics.

A direct method of predicting flow resistance and uniform velocity in alluvial channels was developed. The method covered all known bed-form regimes and not only eliminated trial-and-error computations and use of rigid-boundary channel flow formulas but also avoided the difficulties associated with the use of the various existing alluvial channel flow computation techniques. The study showed that the Darcy-Weisbach friction factor can be expressed as a unique function of the ratio of the bed form and grain shear stress components for any anticipated discharge and flow geometry, the bed-form shear component being uniquely determinable from the flow and channel material characteristics. The results confirmed that the friction factors is non-constant but varies with the bed-form regime. The applicability of the method to laboratory flumes, field canals, and natural rivers was illustrated. (Jess-ISWS)

**FLOODS IN THE WAIAHOLE-WAIKANE AREA, OAHU, HAWAII,**
Geological Survey, Honolulu, Hawaii.
C. J. Ewart, and R. Lee.
Open-file report, 1973. 10 p, 7 fig, 1 plate, 8 ref.

Descriptors: *Floods, *Flood frequency, *Flood data, *Hawaii, Flood profiles, Flood peak, Flood plains, Flood protection, Hydrologic data, Flood forecasting, Hydrographs, Streamflow.
Identifiers: *Oahu(Hawaii), Waiahole-Waikane area(Oahu).

Hydrologic data show the extent and frequency of flooding in the Waiahole-Waikane area of windward Oahu, Hawaii. The data provide a technical basis for the formulation of flood-plain regulations, building and zoning ordinances, the design and location of flood-control projects, and modification or improvement of the existing drainage system. The three main streams in the study area are Waiahole, Waikane, and a smaller unnamed stream, which is located between these two. Waiahole and Waikane streams head near the crest of the Koolau Range and are perrennial; the unnamed stream heads about the 700-foot elevation and is intermittent. The stream gradients are steep in the upper reaches and fairly flat on the coastal flood plain. Inundation boundaries and water-surface profiles for the 50-year flood were estimated by backwater analyses and represent current channel conditions. (Woodard-USGS)

**LOW-FLOW CHARACTERISTICS OF STREAMS IN THE GRAYS HARBOR DRAINAGES, WASHINGTON,**
Geological Survey, Tacoma, Wash.
J. E. Cummans, and E. G. Nassar.
Open-file report, 1975. 27 p, 3 fig, 1 plate, 3 tab, 13 ref.

Descriptors: *Low-flow frequency, *Streamflow, *Hydrologic data, *Washington, Rainfall-runoff relationships, Hydrology, Hydrologic cycle, Analytical techniques, Regression analysis, Seasonal, Flow-rates.
Identifiers: *Grays Harbor drainages(Wash).

Streams in the Grays Harbor drainage area, Washington, are varied in their annual volumes of runoff, and in the amounts of flow available during the low-flow period of middle and late summer. Many small streams are dry in summer. Mean annual precipitation in the area ranges from about 40 inches near Chehalis and Centralia to 220 inches in the headwaters of the Satsop, Wynoochee, and Humptulips River basins. About 10 percent of the precipitation occurs during May to August. Yearly variations in 7-day low flows of the Chehalis River near Grand Mound ranged from about 91 cfs in 1967 to about 261 cfs in 1937. Low-flow-frequency curves plotted from streamflow records at 15 continuous-recording stations having 10 or more years of record were used to determine data for low-flow durations of 7, 30, 60, 90, and 183 days. Regression techniques were used to estimate low flows with frequencies up to 20 years for stations with less than 10 years of record and at miscellaneous sites. Low-flow frequency data are listed for 161 sites. The median of monthly mean flows (monthly mean flow at the 2-year recurrence interval) is presented for selected sites. Factors that influence low flows are described briefly. Truly natural flows--those unaffected by man's activities or diversions--exist in very few streams in the area. (Woodard-USGS)

Descriptors: *Streamflow forecasting, *Stochastic processes, *Statistical models, *Rainfall-runoff processes, River forecasting, Time series analysis, Fourier analysis, Indiana, Ohio, Kentucky, Ohio River.
Identifiers: *ARMA Processes, Multivariate analysis, Disaggregation processes.

The principal tools used are harmonic analysis, time series analysis, the ARMA processes, regression and correlation, principal component analysis, multivariate analysis, and disaggregation processes. Data were used from 32 water-sh

he lower Ohio Basin located principally in Indiana, but also in Illinois, Ohio, and Kentucky. The onclusions are (1) the ARMA models with easonally varying coefficients are based upon the easonally varying serial correlation coefficients. he seasonality of the means, variances, and the ross-covariances can be preserved by using this amily of ARMA models with seasonally varying arameters; (2) the parameters of the ARMA odels for the stochastic component of the stream unoffs are correlated with some of the reional ariables. Their correlations depend on the physioraphical regions of the watersheds, are not sigificantly high but not negligible; (3) the ARMA rocesses can not preserve the long-term depenence of the hydrologic processes, therefore, for ata synthesis, the multivariate disaggregation odel should be used. The multivariate disagegation model preserves long-term properties, ithin-the-year cyclicities, serial correlation, oss-correlation between stations, and rainfall-runoff relationships of the hydrologic processes.

fornia Univ., Santa Barbara. Dept. of hanical and Environmental Engineering.
Shaug, and J. C. Bruch, Jr.
Journal of Hydrology, Vol 26, No 1/2, p 141-152, July 1975. 3 fig, 1 tab, 10 ref. UCAL-WRC-W-428.

Descriptors: *Fluid mechanics, *Boundary processes, *Finite element analysis, *Seepage, *Algorithms, Ditches, Potential flow, Flow nets, Mathematics, Digital computers.
Identifiers: *Equipotential lines, Flow lines, Finite difference equations.

An inverse formulation in conjunction with the finite element method was used to solve a two-dimensional free surface problem. The approach is accurate and has several advantages over the finite difference solution approach. The scheme is easily formulated, efficient, and flexible since it can readily handle the boundary conditions and also any variable shaped curve within the rectangular regions in the complex potential plane. The solutions were performed on a digital computer for seepage from a trapezoidal ditch. The algorithm used allowed the streamlines and equipotential lines to be separated by arbitararily selected increments in the stream function and potential function so that these lines and their intersections could be concentrated in high velocity regions. Included were comparisons between finite element, finite difference, and analytical solutions which show the increased accuracy of the finite element method. (Singh-ISWS)

Identifiers: *Alberta.

The Wainwright map area (about 6000 sq mi) is located southeast of Edmonton between longitudes 110 degrees and 112 degrees west and latitudes 52 degrees and 53 degrees north, lying mostly in the aspen parkland vegetational assemblage. Average precipitation and potential evapotanspiration are 14 inches and 21 inches, respectively. Geologic units of hydrogeological interest include glacial drift, preglacial sands and gravels, and the Horseshoe Canyon, Bearpaw, Belly River, and Lea Park Formations. Contour maps of the following hydrochemical parameters for various depth intervals are presented: total dissolved solids, hardness, Na + K, alkalinity, S04, Cl, and F. Groundwater quality is related to the thickness and nature of the glacial drift and to the character of the underlying bedrock. Areas where the water quality is comparatively good for depths up to 500 feet are usually overlain by 50 to 400 feet of coarse-grained glacial drift. Rapid downward movement of water was hypothesized to account for this good quality. Poorer-quality groundwater is comonly found in areas of thin, fine-grained drift and is apparently the result of slow percolation. Regionally, the area acts as a recharge area for northwestwardly flowing groundwater; while locally, much water is probably discharged in sloughs. (Visocky-ISWS)

Identifiers: *Mounds, Depth of saturation.

Solutions were derived which describe the rise and fall of the water table in extensive unconfined aquifers receiving localized vertical accretion and discharging into a surface reservoir in which the water level remains equal to that of the main flow before the incidence of rechange. The rate of accretion was maintained by a spreading area in the form of an infinitely long strip of finite width. Solutions were also derived for the rise, decline, and maximum height of the water table in an unconfined aquifer bounded by two streams or drains. The water levels in the drains were assumed to be at equal elevation. The aquifer received either time-varying or uniform vertical recharge. In each aquifer system considered herein, the aquifer was assumed to be homogeneous, isotropic, and resting on a horizontal impervious base. In addition, the rate of recharge relative to the hydraulic conductivity was considered so small that the vertically downward recharge was almost completely refracted in the direction of the slope of the water table. The solutions were expressed in terms of the head averaged over the depth of saturation. They are applicable to problems of groundwater flow through aquifers and to land drainage problems when the rise of the water table is smaller than 50% of the initial depth of saturation. **GEOHYDROLOGIC RECONNAISSANCE OF THE UPPER POTOMAC RIVER BASIN,**
Geological Survey, Reston, Va.

F. W. Trainer, and F. A. Watkins, Jr.
Available from Supt of Documents, GPO, Washington, DC 20402, Price $1.95. Water-Supply Paper 2035, 1975. 68 p, 16 fig, 1 plate, 10 tab, 53 ref.

Descriptors: *Hydrogeology, *Geologic formations, *Water resources development, *Potomac River, *Appalachian Mountain region, Pennsylvania, Maryland, Virginia, West Virginia, Water resources, Water supply, Water utilization, Water quality, Groundwater, Surface waters, Aquifer characteristics, Water yield, Test wells, Streamflow, Low flow, Base flow, Water pollution sources, Watershed management, Hydrologic data.
Identifiers: *Upper Potomac River basin.

The upper Potomac River basin, in the central Appalachian region in Pennsylvania, Maryland, Virginia, and West Virginia, is a humid temperate region of diverse fractured rocks. Three geohydrologic terranes, which underlie large parts of the basin, are described in terms of their aquifer characteristics and of the magnitude and duration of their base runoff: (1) fractured rock having a thin regolith, (2) fractured rock having a thick regolith, and (3) carbonate rock. Crystalline rock in the mountainous part of the Blue Ridge province and shale with tight sandstone in the folded Appalachians are covered with thin regolith. Water is stored in and moves through fairly unmodified fractures. Average transmissivity (T) is estimated to be 150 sq feet per day, and average storage coefficient (S), 0.005. Crystalline and sedimentary rocks in the Piedmont province and in the lowland part of the Blue Ridge province are covered with thick regolith. Estimated average values for aquifer characteristics ar T, 200 sq feet per day, and S, 0.01 . Carbonate rock, in which fractures have been widened selectively by solution, especially near streams, has estimated average aquifer characteristics of T, 500 sq feet per day, and S, 0.03-0.04. This rock is the most effective in the basin in terms of water supply and base runoff. Acidic mine-drainage water, local highly mineralized groundwater, and the high nitrate content of groundwater in some areas would probably have little adverse affect on the use of groundwater for low-flow augmentation. (Woodard-USGS)

**DIGITAL-SIMULATION AND PROJECTION OF WATER-LEVEL DECLINES IN BASALT AQUIFERS OF THE ODESSA-LIND AREA, EAST-CENTRAL WASHINGTON,**
Geological Survey, Reston, Va.
J. E. Luzier, and J. A. Skrivan.
Available from Supt of Documents, GPO, Washington, DC 20402 Price - 75 cents. Water-Supply Paper 2036, 1975. 48 p, 29 fig, 12 ref.

Descriptors: *Groundwater resources, *Model studies, *Aquifer characteristics, *Basalts, *Washington, Water supply, Water utilization, Hydrogeology, Hydrologic data, Groundwater movement, Water yield, Groundwater recharge, Computer models, Forecasting, Water levels, Water resources development.
Identifiers: *Odessa-Lind area(Wash).

A digital computer program using finite-difference techniques simulates an intensively pumped, multilayered basalt-aquifer system near Odessa, Wash. The aquifers now developed are in the upper 1,000 feet of a regionally extensive series of southwesterly dipping basalt flow of the Columbia River Group. Most of the aquifers are confined. Those in the depth range of about 500 to 1,000 feet are the chief source of groundwater pumped from irrigation wells. Transmissivity of these aquifers ranges from less than 2,700 sq. ft. per day to more than 40,000 sq. ft. per day, and storage coefficients range from 0.0015 to 0.006. Shallower aquifers are generally much less permeable, but they are a source of recharge to deeper aquifers with lower artesian heads; vertical leakage occurs along joints in the basalt and down uncased wells, which short circuit the aquifer system. For model analysis, the deeper, pumped aquifers were grouped and treated as a single layer with drawdown-dependent leakage from an overlying confining layer. Verification of the model was achieved by closely matching observed pumpage-related head declines ranging from bout 10 feet to more than 40 feet over the 4-year period from March 1967 to March 1971. Projected average annual rates of decline during the 14-year period from March 1967 to March 1981 are: from 1 to 9 feet per year if pumpage is maintained at the 1970 rate of 117,000 acre-feet per year; or, from 3 to 33 feet per year if 1970 pumpage is increased to 233,000 acre-feet per year, which includes 116,000 acre-feet per year covered by water-right applications held in abeyance. Presented at 1974 Annual Meeting of the American Society of Agricultural Engineers, June 23-26, 1974. Stillwater, Oklahoma, Paper No 74-2015. 30 p, 9 fig, 27 ref, append.

Descriptors: *Infiltration, *Soil water movement, *Porous media, *Computer programs, Simulation analysis, Model studies.

A simulation model was developed for the miscible displacement of a conservative solute during one-dimensional vertical infiltration into a homogeneous, isotropic porous media. FORTRAN IV computer programs were written in a general form so that various initial and boundary conditions could be specified as input parameters. Unsteady vertical infiltration, steady flow dispersion, and dispersion during unsteady vertical infiltration into unsaturated, homogeneous, and isotropic porous media were accurately described by the simulation model. The shape of the solute distribution curve with depth is relatively insensitive to the magnitude of the dispersion coefficient for porous media to which the functional relationship used apply and for the range of pore water velocities commonly encountered during infiltration into sand and clay loam soils. Dispersion coefficients are much larger and solute curves are very different for nonhomogeneous, anisotropic porous media than for homogeneous media. Data describing the nonhomogeneous nature of soils will be needed to adequately describe experimental field solute distribution curves. (Skogerboe-Colorado State)

Descriptors: *Porous media, *Seepage, *Mathematical studies, *Steady flow, *Flow around objects, Groundwater, Confined water, Potential flow, Flow, Groundwater movement, Groundwater potential, Underseepage, Numerical analysis, Laplaces equation, Resistance networks
Identifiers: *Axisymmetric flow, *Semi-infinite flow, Potential distribution.

The potentials due to three-dimensional seepage half space with infinite depth of the medium are higher than those for two-dimensional seepage under the downstream half of the floor. Under the upstream half of the floor the potentials are lower than those for the two-dimensional case. By increasing the length to width ratio, the potentials increase for the downstream half of the floor and decrease for the upstream half. This was confirmed by experiment also. The reduction in dep of the pervious stratum was found to reduce the potentials on the downstream half of the floor and increase on the upstream half of the floor. Two-dimensional seepage was similar. (Prickett-ISWS)

New South Wales Univ., Kensington (Australia). Faculty of Military Studies.
A. C. Amar.
Ground Water, Vol 13, No 3, p 282-292, May-June 1975. 9 fig, 16 ref, 2 append.

Descriptors: *Groundwater recharge, *Recharge, *Groundwater, Groundwater movement, Dupuit-Forchheimer theory, Saturated flow, Recharge ponds, Unsteady flow, Water table, Permeability, Mathematical models.
Identifiers: *Strip basin, *Recharge basin.

Formulation and solution of one-dimensional analytical and computational models, linear as well as nonlinear, pertaining to a typical ground-water recharge pattern were presented. The objective was to direct attention toward an evalua-

and correlation of the various theoretical models based on the Dupuit-Forchheimer (D-F) approximations for the unsteady hydrodynamic behavior of the proposed recharge system under saturated flow conditions. Comparisons with the pertinent experimental data, presented in the form of dimensionless graphs, indicated that the linear D-F theory is valid for relatively small water table rises but for large rises it predicts substantially greater rises than actually occur, particularly beneath and in the vicinity of the recharge basin. For relatively large rises, the range of validity between theory and experiments was considerably improved using the nonlinear theory. (Lee-ISWS)

D. A. Nutbrown.
Water Resources Research, Vol 11, No 4, p 581-588, August, 1975. 12 fig, 5 ref, 1 append.

Descriptors: *Groundwater movement, *Hydrologic data, *Systems analysis, *Computer models, *Aquifer systems, Base flow, Model studies, Mathematical studies, Linear programming, Mathematical models, Finite element analysis, Analytical techniques, Transimissivity, Aquifer characteristics, Aquifers, Inflow, Groundwater recharge, Withdrawal.
Identifiers: England, South Downs(England), Linear equations.

An inductive method is presented for evaluating parameters in a two-dimensional linear equation describing groundwater flow. The approach employs finite difference approximations, which can be simply programmed for calculation by computer. Before illustrating the method, which is applicable to both stationary and time-dependent problems, the various types of data required for evaluation in general are systematically enumerated. An assumption is introduced limiting the local variability of T, the tranmissivity, and its relation to apparently similar assumptions used elsewhere is discussed. The particular aquifer chosen for illustration is the chalk of the South Downs between the rivers Adur and Ouse. The parameters are calculated on the basis of cyclic data in which annual abstraction is about 30% of the total infiltration for the year. The method gives a match to the minimum and maximum water levels during the year to within 7%. (Robinett-Arizona)

## 2G. Water In Soils

**SOIL AND HYDROLOGIC FACTORS AFFECTING THE STABILITY OF NATURAL SLOPES IN THE OREGON COAST RANGE,**
Oregon State Univ., Corvallis. Dept. of Forest Engineering.
R. D. Harr, and C. S. Yee.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-244 178, $7.25 in paper copy, $2.25 in microfiche. Oregon Water Resources Research Institute, Corvallis, Completion Report WRRI-33, July 1975. 204 p, 54 fig, 10 tab, 87 ref, 4 append. OWRT A-023-ORE(1).

Descriptors: *Slope stability, Soil mechanics, Subsurface flow, *Soil aggregates, Oregon, Coasts, Hydrology, Piezometers, Particle size, Tensiometers, Soil properties, Soil strength, Porosity, *Soil stability, Soil density, *Soil physical properties, Cohesionless soils, *Oregon Coast Range.

Soil and hydrologic properties of two major cohesionless soils occupying 55% of the central portion of the Oregon Coast Range were examined. Knowledge of these properties was desired to determine the role each played in the stability of slopes in the region. Bohannon and Klickitat soils often occupy the steep midslopes where the greatest potential for stability problems exists. The Bohannon series is derived from Tyee sandstone and the Klickitat series is derived from intrusive, igneous parent material. Soil samples were obtained from four widely separated sites, two for each of the soil series and were examined for particle-size-distribution, bulk density, porosity, pore-size distribution, aggregate stability, saturated and unsaturated hydraulic conductivity, and shear strength. Both soils, although derived from very different parent materials, exhibited nearly identical ranges of values for soil and hydrologic properties. Both were extremely porous, highly permeable, very well aggregated and graded, sandy to gravelly cohesionless soils. From engineering and hydrology standpoints, the two soil series can be considered as one.

**FIELD TEST OF SOIL WATER FLUX METERS,**
Agricultural Research Service, Riverside Calif. Salinity Lab.
C. Dirksen.
Presented at 1974 Annual Meeting of the American Society of Agricultural Engineers, June 23-26, 1974. Stillwater, Oklahoma, Paper No 74-2039. 12 p, 4 fig, 1 tab, 5 ref.

Descriptors: *Soil water movement, *Drainage, Soil investigations, *Soil moisture, meters, Soil properties, *Instrumentation, *Measurement, *On-site tests.

Soil water flux in a draining soil profile was measured with flux meters featuring variable hydraulic resistances. As the hydraulic conductivity of the soil changes, the meter resistance is adjusted such that the overall hydraulic head loss across the meter matches that measured with tensiometers in undisturbed soil nearby. The soil water flux is then equal to that through the meter and is derived from the calibration of the resistance. If this match is not quite perfect, the remaining small amount of divergence or convergence of flow is calculated with an empirical relationship, independent of the magnitude of the flux and the hydraulic properties of the soil. The soil water fluxes were measured in essentially undisturbed soil, since the meters were installed from a horizontal direction. Such installation is possible by using a compression spring that pushes thin filter plates against the top and bottom of undisturbed soil surfaces excavated to a certain size with a specially designed apparatus. A slanted pin used to constrain the spring permits the meter to be installed and retrieved repeatedly. Two flux meters of different sizes and with different hydraulic resistances were tested side by side in a field plot and gave consistent, satisfactory results. (Skogerboe-Colorado State)

Descriptors: *Diffusivity, Methodology, Soil water, *Soil water movement, Soil properties, Computers, Discharge(Water).

A method is developed whereby effective or weighted mean diffusivity, D, can be estimated by using outflow data. These estimates can further be analyzed for soil water diffusivity, D theta, with the help of a step-wise function and the relationship given by Crank (1956). The suggested procedure for estimating soil water diffusivity is more accurate than previous methods because no assumption of constant diffusivity either over the pressure increment or over the length of the soil core is required. Moreover the procedure does not use the early part of the outflow curve and thus reduces the effect of membrane impedance on the estimates of D theta. The method was tested by simulating outflow experiments on a digital computer, and using data obtained to calculate diffusivities. Estimates of diffusivity were in better agreement with the actual diffusivities than those obtained with the earlier 'one-step' method. (Skogerboe-Colorado State)

**UNSATURATED HYDRAULIC CONDUCTIVITY FROM CUMULATIVE INFLOW DATA,**
Hawaii Univ., Honolulu. Dept. of Agronomy and Soil Science.
L. R. Ahuja.
Soil Science Society of America Proceedings, Vol 38, No 5, p 695-699, September-October, 1974. 6 fig, 13 ref.

Descriptors: *Hydraulic conductivity, *Infiltration, *Diffusivity, Soil properties, Clays.

A method of determining the wetting-phase unsaturated hydraulic conductivity K theta from the data of cumulative inflow into a uniform soil core when water enters through a porous plate of high hydraulic resistance is described and evaluated. The method is based on piece-wise application of the Green and Ampt (1911) approach to the above process of infiltration. The K theta determined by this technique from the numerical-solution inflow data of Yolo light clay were within 20% of the K theta values actually used in obtaining the numerical solution in two different cases of hydraulic resistance. Similar analysis of the experimental inflow data of Salkum silty clay loam for four different hydraulic resistances yielded the K theta data which closely agreed with the K theta values determined by detailed analysis of the soil-water content transients. **CHLORIDE AND TRITIATED WATER FLOW IN DISTURBED AND UNDISTURBED SOIL CORES,**
Kentucky Univ., Lexington. Dept. of Agronomy.
M. A. McMahon, and G. W. Thomas.
Soil Science Society of America Proceedings, Vol 38, No 5, p 727-732, September-October, 1974. 6 fig, 4 tab, 13 ref.

Descriptors: *Soil water movement, Soil properties, Water chemistry, *Chlorides, Nitrates, Soil investigations, Soil physics, Anions.
Identifiers: *Tritiated water.

Columns of disturbed and undisturbed Eden, Maury, and Pembroke soils were eluted with CaCl2 in tritiated water. The chloride was used as a substitute for nitrate since it is not affected biologically. The experiments were carried out to investigate the effects of natural soil structure on the flow of water and chloride. In all three soils flow was less stable in the undisturbed cores judging from the shape of the curve and the points of initial tritiated water and chloride breakthrough.

Chloride moved through the undisturbed Eden and Maury soils faster than through the disturbed columns. Both soils exclude anions to a significant extent. In the Pembroke soil, which adsorbs anions, the chloride was retarded in the undisturbed column as compared to the disturbed column. The results suggest that field movement of water and anions is not described very well by columns of disturbed, packed soils. (Skogerboe-Colorado State)

Florida Univ., Gainesville.
W. K. Robertson, P. E. Pope, and R. T. Tomlinson.
Soil Science Society of America Proceedings, Vol 38, No 5, p 855-857, September-October 1974. 4 fig, 2 ref.

Descriptors: *Sampling, *Soil investigations, Soil properties, Soil surveys, Soil tests, Leaching.

A tool is described that can be attached to a commercially available soil sampler that will take undisturbed soil cores 15 cm in diameter and 75 cm long in corlon tubes. The tubes were sealed at the bottom with a sheet of plastic in which drainage tubes were inserted. Leaching studies could be made when tubes containing cores were placed on racks in the greenhouse. Further refinements include suction cups at regular intervals in the side of the column for nutrient movement studies and porous plates at the top and/or the bottom to make moisture tension in the profile similar to natural conditions. **KINETIC AND EQUILIBRIUM STUDIES OF BORON DESORPTION FROM SOIL,**
California Univ., Davis. Dept. of Soils and Plant Nutrition.
R. A. Griffin, and R. G. Burau.
Soil Science Society of America Proceedings, Vol 38, No 6, p 892-897, November-December, 1974. 6 fig, 2 tab, 19 ref.

Descriptors: Boron, Adsorption, *Kinetics, Soil texture, *Soil chemistry, Soil tests, Soil investigations, *Equilibrium
Identifiers: *Boron desorption.

Kinetics of boron desorption from soil were determined using 0.05M mannitol solutions to create pseudo first-order reaction conditions. The results showed two separate pseudo first-order reactions and one very slow reaction for which detailed kinetic treatment was not attempted. The relative amount of boron associated with the two fast reactions was independent of soil texture and of initial sample boron content. It was postulated that the two reaction rates were due to desorption from two independent boron retention sites. It was speculated that the two fast reactions were due to desorption from hydroxy iron, magnesium, and aluminum materials in the clay fraction. The third or slowest reaction rate was probably due to diffusion of boron from the interior of clay minerals to solution phase. Equilibrium studies showed that boron desorption followed a 2-site analog of a linear form of a 1-site Langmuir expression. Langmuir adsorption maximum values for each site corroborated those calculated from the kinetic study and supported the multisite interpretation of the kinetic data. (Skogerboe-Colorado State)

N. C. Turner, and J-Y. Parlange.
Soil Science Society of America Proceedings, Vol 39, No 3, p 387-390, May-June 1975. 3 fig, 1 tab, 5 ref.

Descriptors: *Soil water, *Infiltration, *Infiltration rates, Diffusion, Moisture content, Sands.
Identifiers: *Soil water potential, *Moisture profile, *Soil-water diffusivity, Bruce and Klute method, Similarity solution.

A similarity solution exists in two-dimension when a constant flux is imposed along a line source. Following the Bruce and Klute method in one-dimension, this similarity solution can be used to determine the soil water diffusivity. The application of the method was illustrated for a sandy loam. The advantage of the method is that the slope of the moisture profile is finite and easily measured, even close to the source. (Lee-ISWS)

Identifiers: *Model sensitivity analysis, *Chickasha(Okla), Layered soils.

Soil moisture in two layers of a soil nea Chickasha, Oklahoma, was simulated using th USDAHL-74 Model of Watershed Hydrology Weekly values computed for both layers com pared well with those observed during a 15-mont period. Certain key parameters required adjus ments in the model which illustrate the need fo accurate input information. The experimen demonstrated that the model, which has prev ously given good results in continuous streamflo prediction on watersheds up to 100 square mile could also compute soil moisture continuously at site. This capability suggested other model use for example, in monitoring the disposition of a plied chemicals. (Prickett-ISWS)

Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
V. Yevjevich.
Hydrology Papers No 72, May 1975. 39 p, 58 fig, 8 tab, 8 ref. NSF GK-31521X, DAC-23-72-C0042.

Descriptors: *Time series analysis, *Great Lakes, Synthetic hydrology, *Computers, *Analytical techniques, *Lake Erie, *Lake Ontario, Statistical methods, Flow, Water storage, Frequency, Distribution patterns, Retardance, Channels, Water supply.
Identifiers: *Flow retardation, Autocorrelation, Principal component analysis.

Statistical tests were performed and 20 samples, each 50 years long, were generated in respect to three variables related to water inputs and retardation of flows in connecting channels of the Great Lakes. The three variables were mean monthly net basin water supplies of five lakes, mean quarter-monthly net basin water supplies of lakes Ontario and Erie, and flow retardations in connecting channels because of freezing and weed effects. Periodic parameters in all three variables were found to be the mean and the standard deviation. The autocorrelation coefficients and skewness coefficients were found not to be periodic. The stochastic components, after the periodic mean and standard deviation were identified and removed, were found to be greatly autocorrelated. The simple first- and second-order autoregressive linear models were found sufficient to describe these tendencies. The principal component analysis was used in generating the new samples of the mean monthly net basin supplies. (Singh-ISWS)

**GREAT LAKES WATER LEVELS, 1974, DAILY AND MONTHLY AVERAGE WATER SURFACE ELEVATIONS.**
NOAA National Ocean Survey, Washington, D.C.
Availability statement for sale by Lake Survey Center, 630 Federal Building and U.S. Courthouse, Detroit, MI 48226, for $2.50. May 1975. 106 p.

Descriptors: *Great Lakes, *Water levels, Water control, *Gaging stations, *Water levels fluctuation, Water level recorders, Flow measurement, Lakes, Water analysis, Gages, Measurement, Elevation, Fluctuations.
Identifiers: Water elevations, *Water level gages, Lake levels, Lake elevations.

This publication contains Lake Survey Center Great Lake water-level gage records and shows in tabular form daily and monthly average levels for each gage in the network for the calendar year. It also contains, in a separate table, the highest and lowest daily average for the month. In addition a frequency distribution table of daily average levels shows the number of times each month the recorded levels were above a specified elevation. The gages record water levels in either analog or a digital form on strip charts that are retained for a period of 10 years. Recorded hourly values were used to compute the daily averages, and the monthly values were compiled from the daily averages. (NOAA)

Identifiers: Data sources, Water quality data, Lake levels, Hydrographic records, Meteorological records, Ice measurement.

Data sources included in this and the proceeding report (Powers, Jones, and Ayers, 1959) are municipal, industrial, power plant and a few military water treatment plants. Published water quality data from academic, governmental or private sources were not included. The data sources have not been used by many investigators because of the inaccessibility of the data or many people were not aware of its existence. This report provides information on sources of raw numerical data. It gives qualitative not quantitative information. The report is divided into two parts; hydrographic and meteorological. The hydrographic section deals with water intakes in one of the five Great Lakes or their interconnecting waterways. The St. Lawrence River was not included as part of the study. The meteorological section includes those weather stations around the Great Lakes up to a distance of 125 miles inland. (NOAA)

## Group 2I—Water In Plants

**DIURNAL PATTERNS OF WATER POTENTIAL IN ABIES CONCOLOR AND PINUS PONDEROSA,**
Canterbury Univ., Christchurch (New Zealand). School of Forestry.
J. E. Barker.
Can J For Res, Vol 3, No 4, p 556-564, 1973. Illus.

Descriptors: *Diurnal distribution, *Ponderosa pine trees, Coniferous trees, *White fir trees, Soil moisture, Stomata.
Identifiers: Stomatal aperture.

Diurnal patterns of water potential for A. concolor and P. ponderosa were studied in relation to concurrent environmental conditions. Up to 86% of variation in water potential was accounted for using irradiance, square root of vapor pressure deficit, height and stomatal aperature as independent variables in A. concolor while up to 76% was accounted for in P. ponderosa using the same variables. Under comparable environmental conditions, A. concolor experienced lower water potentials than P. ponderosa due to its relative lack of stomatal control and its greater sensitivity to changes in vapor pressure deficit. Height effects were very nearly identical to those predicted by the cohesion theory. A procedure for estimating available soil moisture is suggested.--Copyright 1974, Biological Abstracts, Inc.

**CONTRIBUTION TO THE ECOLOGY OF INDIAN AQUATICS: IV. RATE OF DRY MATTER PRODUCTION OF THE LEAVES OF SEVERAL COMMON AQUATIC PLANTS OF GORAKHPUR (INDIA),**
Saint Andrews Coll., Gorakhpur (India). Dept. of Botany.
A. B. Sinha, and R. Sahai.
Photosynthetica (Prague), Vol 8, No 2, p 127-129, 1974.

Descriptors: Ecology, *Aquatic plants, Cultures, *Leaves, Respiration, *Plant physiology, Stomata, Production.
Identifiers: Aponogeton-natans, *Dry matter production, Eichhornia-crassipes, *India(Gorakhpur), Marsiles-minuta, Nymphaea-stellata, Nymphoides-cristatum, Salvinia-natans.

Dry matter accumulation per unit area of leaves of 6 common aquatic plants of Gorakhpur (India), viz., Eichhornia crassipes, Salvinia natans, Nymphaea stellata, Nymphoides cristatum, Aponogeton natans and Marsilea minuta was determined under laboratory conditions by the leaf disc method. Maximum rate of net production (1.43 g dry matter m-2 h-1) was found in E. crassipes, while M. minuta has the minimum rate (0.81 g dry matter m-2 h-1). The respiratory loss of dry matter was greatest in E. crassipes (0.56 g dry matter m-2 h-1) and minimum (0.16 g dry matter m-2 h-1) in A. natans. The stomatal frequency of the leaves has no definite influence on the rate of dry matter accumulation in these plants.--Copyright 1974, Biological Abstracts, Inc.
W75-11386

**A WATER POTENTIAL THRESHOLD FOR THE INCREASE OF ABSCISIC ACID IN LEAVES,**
New York State Cooperative Extension Service, Penn Yan.
T. J. Zabadal
Plant Physiol, Vol 53, No 1, p 125-127, 1974. Illus.

Descriptors: *Leaves, Acids, Dehydration, Stomata, *Plant physiology.
Identifiers: *Abscisic acid, *Ambrosia-artemisifolia, *Ambrosia-trifida.

A relationship between abscisic acid concentration and leaf water status is reported. Water potentials were measured in leaves of Ambrosia artemisiifolia L. and A. trifida L. throughout a period of dehydration of intact plants. Tissues from the same leaves were analyzed for abscisic acid. For both species, abscisic acid began to increase in a critical water potential range (-10 to -12 atmospheres). These data suggest a threshold water potential that stimulates abscisic acid synthesis. The data support the hypothesis that a small change in water potential could affect stomatal resistance to water loss by means of very sensitive chemical feedback control mechanism.--Copyright 1974, Biological Abstracts, Inc.

**HABITAT HETEROGENEITY AND AVIAN COMMUNITY STRUCTURE IN NORTH AMERICAN GRASSLANDS,**
Oregon State Univ., Corvallis. Dept. of Zoology.
J. A. Wiens.
Am Midl Nat. Vol 91, No 1, p 195-213, 1974, Illus.

Descriptors: *Birds, *Habitats, *Wildlife habitats, *Populations, *Environmental effects, Food and cover crops, Brushlands, *Grasslands, Analysis.
Identifiers: Steppe, *Bird populations, Vegetational heterogeneity.

In a variety of environments, patchiness of habitat structure appears related to faunal diversity. The relations between vegetational heterogeneity and several attributes of avian communities over a range of North American grassland and shrub steppe situations were examined. Habitat heterogeneity was measured by assessing the variability in vertical density of vegetation within clustered point samples and an index to express this horizontal patchiness was derived. Heterogeneity was directly related to the areal coverage of bare ground and woody vegetation and to patchiness in litter distribution of sample plots and inversely related to grass coverage and litter depth. Heterogeneity generally increased with decreasing annual precipitation and primary production, tall grass-prairie sites being the least and western shrub steppe the most heterogeneous. Analysis of breeding bird population censuses from these plots revealed no apparent relationships between habitat heterogeneity and the diversity of breeding avifaunas or the extent of spatial (territorial) overlap between species. The density of breeding bird populations decreased slightly with increasing vegetation patchiness; the standing crop biomass of the avian community, however, decreased markedly as heterogeneity increased. This pattern appeared to result from a replacement of large-sized species by medium-sized species in the transition from tall grass to short grass areas and an increasing dominance of small-sized species in the western Palouse and shrub steppe sites.--Copyright 1974, Biological Abstracts, Inc.

**EFFECT OF WATER STRESS, TEMPE TURE, AND LIGHT ON PHOTOSYNTHESIS ALDER SEEDLINGS,**
Helsinki Univ. (Finland). Dept. of Silviculture
P. Hari, and O. Luukkanen.
Physiol Plant, Vol 29, No 1, p 45-53, 1973. Illus

Descriptors: Carbon dioxide, *Se *Photosynthesis, Temperature, Plant man ment, Light, Mathematical models.
Identifiers: *Alderseedlings, Alnus-incana.

Seedlings of Alnus incana (L.) Moench were died in controlled environmental conditions. photosynthetic capacity of 4 plants simultane as well as light, temperature, and atmosp water pressure deficit were continuously rec during approximately 2 mo. The potted were continuously given known quantitie water. Two different effects of water stress found in the experimental plants. When suff amounts of water had been available to photosynthetic CO2 fixation rates largely foll the variation in temperature and light. On the hand, after prolonged water stress, higher peratures caused a large decrease in net CO take even if the plant apprently had suff water during the actual measurements. Po mechanisms for this effect are discussed. E of water stress on photosynthesis were studie constant temperature as well as in cond where temperature, light, soil water conten atmospheric water vapor pressure were allo vary in a complex pattern. Mathematical m for expressing net CO2 uptake as a function vironmental variables were constructed fo

these experimental situations. However, only
latter approach clearly domonstrated the fun-
mental role of temperature in controlling the
otosynthesis of plants under water stress.--

rs.

earch was summarized on the properties of the
ulent entrainment across stable density-
tified layers, a phenomenon commonly ob-
ed in geophysical fluid dynamics. A turbulent
ironment was created by oscillating grids in
si-homogeneous layers of slightly different
sity separated by thin sheets of fluid containing
trong density gradient. The buoyancy flux
ss thin stable layers was found to be a func-
of the Richardson and Prandtl numbers.
oretical and experimental studies were made,
ing to a determination of the order of mag-
de of the four terms expressing the balance of
gy in physical space. It was shown that the
ulent energy flux is of the same order of mag-
de as the viscous dissipation of kinetic energy
e quasi-homogeneous layers where the slight
sity gradient is not altogether negligible
use a small but measurable fraction of the tur-
nt energy flux goes into maintaining the

, Streams, Width, Shear, Velocity, Particle
*Reviews.
tifiers: *Sediment transport theories.

t sediment transport theories were examined
reference to flume and field data. The com-
on was based on over 1000 flume experiments
rtz and lightweight materials) and 260 field
surements. Froude numbers greater than 0.8
excluded and no allowance was made for wall effects and bank friction. The available data were classified in terms of the dimensionless parameters of grain size, mobility number, flow depth, and relative density. The characteristics of the flume and field data very considerably in terms of the breadth/depth ratio. Depth/diameter ratios for flume data are generally much lower than those for the field data for similar dimensionless particle size. There is a significant lack of field data in the range of 1.5-20 mm sand sizes. Using the criterion proposed by Engelund, most of the available data in the range of sand diameters greater than 0.6 mm consist of bed load measurements. The most reliable equation applicable over a wide range of flow conditions and particle characteristics is the general function of Ackers and White. The Engelund and Hansen method was also very reliable but errors were marginally higher. The Rottner bed load equation can be used with confidence as a total load theory. The behavior of several of the theories which are based on excess shear velocities or excess mobility numbers, together with observations of sediment movement for coarse sediments apparently below the threshold conditions defined by Shields, showed a clear need for further work in this area. Threshold conditions for coarse uniform and nonuniform sediments should be studied. (Lee-ISWS)

**RIVER REGIME WITH SPECIAL REFERENCE TO RIVER NILE,**
Assiut Univ. (Egypt). Dept. of Hydraulics.
M. B. Khalil.
Journal of Hydraulic Research, Vol 13, No 2, p 149-170. 8 fig, 32 ref.

Descriptors: *Channel morphology, *Alluvial channels, *Sediment transport, *Floods, *Roughness(Hydraulic), Sediment distribution, Boundary processes, Irrigation canals, Gradients(Streams), Gaging stations, Regime.
Identifiers: *Nile River, *Regime theory, Lacey's equations, Egypt.

Regime theory concept of independent adjustment of slope, depth, and bed width was found irrelevent when applied to River Nile. Slope, depth, and width of the river are intercorrelated and are mutually adjusted to attain regime conditions. Two relations were expressed to describe the geometry of River Nile channel, namely silt equations and flow equation. The silt equation relates the discharge, depth, and slope in non-dimensional form to the silt concentration. The flow equation expresses the mean velocity as a function of depth, slope, and the median grain size of the bed. The factor of proportionality of the flow equation, a numerical constant, confirms that of Swiss rivers and is probably a universal constant. In the absence of a theoretical approach to regime of channels in alluvium, the Nile flow and silt equation, based on actual observations, seem to provide a suitable tool for rational calculations of current problems such as resettling the reach of the Main Nile disturbed by the construction of Aswan High dam and in designing of Jonglei canal. **SEDIMENT RELATIONS OF SELECTED ALASKAN GLACIER-FED STREAMS,**
Alaska Univ., College. Inst. of Water Resources.
G. L. Guymon.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-245 014, $3.25 in paper copy, $2.25 in microfiche. Report No IWR-51, June, 1974, 17 p. OWRT A-042-ALAS(4).

Descriptors: *Sediment transport, *Sediment yield, *Alaska, Model studies, Equations, Water supply, Glaciology, *Glacial sediments, Suspended load, Suspended solids, Sediment discharge.
Identifiers: Glacial streams.

This research contributes to the general scientific study of sediment processes in Alaska by establishing baseline sediment-related, environmental conditions; initiating support studies related to other glaciology studies; collecting qualitative as well as quantitative knowledge of glacial runoff sediment processes; and providing additional information for water supply studies. Two equations are developed--one models the transport of suspended sediments in glacier-fed streams by calculating suspended sediment concentration in the glaciers melt water outflow; and a second model for estimating regional suspended sediment yield in streams.

**GEOCHEMISTRY OF SURFACE SEDIMENTS IN AN ACID STREAM ESTUARY,**
University Coll. of North Wales, Menai Bridge. Marine Science Labs.
P. Foster, and D. T. E. Hunt.
Marine Geology, Vol 18, No 2, p M13-M21, February, 1975. 2 fig, 1 tab, 14 ref.

Descriptors: *Estuary, *Chemical analysis, *Trace elements, Acid streams, Heavy metals, X-ray fluorescence, *Deposition(Sediments, Zinc, Copper, Manganese, Iron, *Path of pollutants.
Identifiers: *North Wales, Transition elements, Bulk sediment.

Selective chemical attack has been used to separate recent surface marine sediments into organic, non-detrital and detrital components, and the concentration of iron, manganese, copper and zinc in each fraction determined. The non-detrital fraction controlled the overall elemental concentrations and relationships apparent in the bulk sediment, particularly in the case of copper, manganese and zinc. Copper was found associated with the organic fraction. The predominant processes of primary deposition are precipitation of hydrated ferric oxide and adsorption of copper and zinc onto this material. **CHEMICAL COMPOSITION OF AEGEAN SEA SEDIMENTS,**
Imperial Coll. of Science and Technology, London (England). Applied Geochemistry Research Group.
P. A. Smith, and D. S. Cronan.
Marine Geology, Vol 18, No 2, p M7-M11, February, 1975. 1 fig, 2 tab, 6 ref.

Descriptors: *Trace elements, *Heavy metals, *Sediment distribution, Mining, Oceans, Sea water, Aluminum, Magnesium Calcium, Tin, Iron, Manganese, *Pollutant identification.
Identifiers: *Aegean Sea, *Mafic rocks, Mineralization.

The partial composition of 241 sediment samples from the Aegean Sea, analyzed for Ca, Mg, Al, Ti, Fe, Mn, Ni, Cr, Pb, Cu, and Zn, can be largely explained by admixture of terrigenous components of variable composition and biogenic components poor in minor elements. Cr and Pb appear to be enriched owing to the occurrence of mafic rocks and minor Pb mineralization onshore. Variations in elemental abundances within the Aegean Sea can generally be accounted for by differences in depositional environment, except at Sounion where anomalous concentrations of Pb and Zn are probably associated with onshore mining activity. Dalhousie Univ., Halifax (Nova Scotia). Inst. of Oceanography.
R. Wheeler.
Limnology and Oceanography, Vol 20, No 3, p 338-342, May 1975. 7 fig, 20 ref.

Descriptors: *Films, *Surface tension, *Air-water interfaces, This films, Pressure, Proteins, Collapse, Sea water, Organic matter, Particle size, Hydrocarbon chain, Laboratory tests, On-site investigations, Bubbles, Lakes, Water.
Identifiers: *Organic films, *Sargasso Sea.

Films that accumulate from lake water, coastal seawater, and Sargasso Sea water with low concentrations of added portein can collapse when subjected to increased surface pressure. Collapse is accompanied by the transformation of some film organic material to particulate material that cannot spread at the interface; these particles are formed from filter-passing organic material previously in the bulk liquid. Film collapse and accompanying particle formation in nature may be a part of a process that, in some areas, removes filter-passing surface-active material from water and precipitates it as particles back into the water column. Such particles tend to sink and could provide particulate food to organisms in the surface waters and perhaps at greater depths. (Lardner-ISWS)

**GEOCHEMISTRY AND GENSIS OF FLUORIDE-CONTAINING GROUND WATERS IN INDIA,**
Soil Research Lab., Chandigarh (India).
S. K. Handa.
Ground Water, Vol 13, No 3, p 275-281, May-June 1975. 3 fig, 3 tab, 18 ref.

Descriptors: *Geochemistry, *Groundwater, Fluorides, Mineralogy, Mineral water, Geologic control, Correlation analysis, Thermodynamics, Aqueous solutions, Equilibrium, Saturation, Solutions, Ions, Ion exchange, Calcium, Bicarbonates, Nitrates, Evaporation.
Identifiers: *India, *Fluorite, *Apatite, Mineralization, Genesis, Mass law, Integral equation.

The fluoride content of groundwater in India varies considerably. Among factors which control the concentration of fluoride are the climate of the area and the presence of the accessory minerals, fluorite, and/or apatite in the rock mineral assemblage through which groundwater is circulating. Regional and tectonic factors also play some part in affecting the fluoride concentration of groundwaters. In general, there is a negative correlation between calcium and fluoride concentrations and a positive correlation between fluoride and bicarbonate concentration in groundwaters with high fluoride content. Thermodynamic calculations show that some of these high fluoride groundwaters are supersaturated with respect to fluorite. In water sources from Rajasthan, high fluoride concentrations are generally accompanied by high nitrate concentrations. A solution-evaporation-base exchange hypothesis was put forward to explain the genesis of these groundwaters. In some parts of India, the fluoride content of groundwaters is below 0.5 mg/l, indicating that fluoridation of water supplies may be desirable in these places. (Visocky-ISWS)

Identifiers: *Danube-Dniester irrigation canal, *Hydrochemical conditions, Interfluve, *Limans(Interfluve), *Black Sea.

Hydrochemical regime and peculiarities in development of phytoplankton, zooplankton and zoobenthos in the Danube-Dniester interfluve limans was studied during 1966-1972. Hydrochemical regime and development of flora and fauna in these limans, except for the Dniester liman, depend on the regime of the north-western part of the Black Sea, marine and eurihaline freshwater-subsaline water flora and fauna develop in them. Freshwater-subsaline water prevails in the composition of the flora and fauna. The data may be used to predict changes in hydrochemical and hydrobiological regimes of the Danube interfluve limans in connection with long-term plans for the Danube-Dnieper irrigation canal.--Copyright 1975, Biological Abstracts, Inc.

S. J. Pinless.
The Institution of Civil Engineers Proceedings, Part 2, Research and Theory, Vol 59, p 255-264, June 1975. 5 fig, 5 ref.

Descriptors: *Estuaries, *Tides, *Numerical analysis, *Tidal effects, Mathematical models, Hydrodynamics, Water level fluctuations, Boundaries(Surfaces), Model studies.
Identifiers: *Boundary conditions, *Thames Estuary(England), Tidal barriers.

The tidal input at the seaward boundary of an estuary model has usually been made to conform to the existing tidal curves. If the model was used to investigate the effects of major physical changes in the estuary, it did not show any effect of these changes on the water levels at the seaward boundary of the model. This difficulty was overcome by locating the model boundary sufficiently far from the sources of any disturbance in the estuary to be unaffected by it. Since observed data were not always available for input at the suitable boundary, a method was developed for computing input for the numerical model from observations at a tide gage within the estuary. The method of seaward extension of a one-dimensional numerical model was described and results from its application to the Thames Estuary were presented. (Adams-ISWS)

Identifiers: *Russian River(Calif), *Shorelines, *Waterways, Wave energy, Closure.

Sixty miles north of San Francisco on the north central coast of California the Russian River enters the Pacific Ocean near the small community of Jenner. Since the mid-19th century, there have been attempts to create and maintain a navigable channel between the river and ocean. In 1941, the construction of a single jetty at Jenner was completed. The jetty failed in its original purpose; however, it was realized later that it was of considerable importance in providing a channel for the ingress and egress of fish to and from spawning grounds in the river. For about 2 months (October and November) a year, a sand bar forms across the Russian River mouth allowing little or no water to flow from the river to the sea. In late spring, the mouth is usually open to some degree. However, as wave power increases in early August, the onshore movement of sand increases. The result of this movement is that a sand bar forms across the river mouth and closes it. With the exception of short periods of intermittent breaches in the sand barrier, the mouth usually does not reopen unitl the occurrence of heavy stream flow, usually starting in early December. Identifiers: *Shorelines, *Whatcom County(Wash), Longshore currents.

Washington State's Shoreline Management Act of 1971 required that all counties prepare master plans for the use of their shorelines. These plans were based on information obtained from inventories of several coastal characteristics, including present land use, land ownership, and natural characteristics. This study was an inventory of the geomorphology of the marine shoreline of Whatcom County, and it included a discussion of those aspects of the geomorphology that needed to be considered in managing shoreline use. The inventory, undertaken between March and July 1972, was carried out by traveling along the coast and recording relevant data on an inventory form. Using the data collected, the shoreline was divided into 22 homogeneous segments, and problems which might arise should the morphology and dynamics of the segments be ignored were identified. Technical Report No 75-5, May 1975. 299 p, 24 fig, 48 tab, 112 ref, 6 append. SG 04-5-158-4, NPS 1910P21157.

Descriptors: *Georgia, *Atlantic Coastal Plains, Ecology, *Ecological distribution, *Balance of nature, Biology, Geology, *Biogeography, Environment, History, Wildlife, Vegetation, *Seashores, Microbiology, Habitats, Natural resources, Insects, Mammals, Aquatic life, Marine animals, Islands, Soil surveys, National parks.
Identifiers: *Cumberland Island seashore(Geo), Camden County(GA), Terrestrial communities, Fauna surveying, Vegetation sampling.

This study was initiated in 1973 to contribute to the understanding of the ecology of the island. The objectives were to inventory and describe the natural resources within the boundaries of the Cumberland Island National Seashore and to generally describe their functions and relationships. The study area was defined to exclude mainland properties of the National Park Service; it was bounded by the Intracoastal Waterway on the west, the St. Marys River on the south, St. Andrews Sound on the north, and the Atlantic Ocean on the east. Emphasis was on the terrestrial communities of Cumberland (primarily) and Little Cumberland Islands. The offshore and inshore waters were excluded; their structure and function have been summarized previously (Johnson et al. 1975). The approach included detailed sampling, analysis and mapping of vegetation, and extensive surveying of the general fauna with intensive sampling of certain groups. The U.S. Soil Conservation Service cooperated by conducting a soil survey, and other cooperators contributed results of their studies on history, geology, and small mammals. (NOAA)

Identifiers: *Vermilion Bay, *Vermilion River, *Atchafalaya River, River discharge, Coastal population statistics, Area description.

The VermilionBay-Atchagalaya Bay estuarine complex is a vast open water brackish system whose primary sources of freshwater are the Atchafalaya and Vermilion Rivers. There are approximately 475, 000 surface acres within the system. Vegetation in the complex varies from fresh to brackish, depending on nearness to the mouth of the Atchafalaya River. Vegetation near the River is almost totally fresh while vegetation farther to the west consists mainly to brackish plant species. Also presented are tabular data on river discharge, coastal population statistics, and sources and quantities of induxtrial waste discharged into the system. This report is divided into four phases; Phase I is an area description Phase II is concerned with the biology of the area Phase III provides hydrology and water chemistry information, and Phase IV describes the sedimentology. SEDIMENTATION RATES IN A LONG ISLAND MARSH DETERMINED BY PB210 DATING,
Brookhaven National Lab., Upton, N.Y.
J. V. Armentano, and G. M. Woodwell.
Limnology and Oceanography, Vol 20, No 3, p 452-456, May 1975. 2 fig, 1 tab, 14 ref.

Descriptors: *Radioactive dating, *Sedimentation rates, *Lead radioisotopes, *New York, Tidal marshes, Coastal marshes, Deposition(Sediments), Sediments, Organic matter, Measurement, On-site investigations.
Identifiers: *Flax Pond, *Long Island(NY), Spartina alteniflora.

Mean rates of vertical accretion of from 0.47 to 0.53 cm/yr have been determined for the past century from two widely separated sites at Flax Pond, Spartina alterniflora marsh on the north shore of Long Island. The chemical processes and experimental results from the Pb activity, which was used to date the sediments, was discussed. The rates were equivalent to deposition of 325 to 436 g of dry organic matter per square meter per year or about 146 to 196 g of carbon per square meter per year. Although the two sites differed in salt peat thickness, the basal layer of the peat was deposited about 100 years ago at both. (Lardner-ISWS)

Journal of the Waterways, Harbors, and Coastal Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 100, No WW4, Proceedings paper No 10922, p 267-278, November 1974. 15 fig, 9 ref.

Descriptors: *Coastal engineering, *Currents(Water), Waves(Water), Analytical techniques, Deep water, Gravity waves, Frequency, Wind velocity, Probability, Equations, *Statistics.
Identifiers: *Inflextion points(Mathematics), Minimax technique, Random processes, Specular reflection, Surface waves, Sea surface, Density function.

The influence of wave-current interactions on various wave statistics is examined analytically. The statistics considered are those of peak magnitude, numbers of zero crossings and maxima, velocities of zeros, specular points, and points of inflexion of sea surface. The sea surface is considered both as a function of space and time. The random wave field is assumed to be unidirectional, zero mean, Gaussian, stationary and homogeneous, and in deep water. The current is considered to be steady in time, nonuniform in space, uniformly distributed in depth, and in or opposite to the direction of the waves. Numerical results are obtained and presented graphically. Results indicate that the interactions phenomena have a relatively mild influence on the maxima of sea surface but the rate of zero crossings and maxima of sea surface, treated as function of space, and the velocity of zeros, specular points, and points of inflextion, are affected by the presence of current to an appreciable extent and can be utilized effectively for current measurements by remote sensing devices. # 3. WATER SUPPLY AUGMENTATION AND CONSERVATION

## 3A. Saline Water Conversion

GYPSUM SOLUBILITY AND SCALING LIMITS IN SALINE WATERS,
California Univ., Los Angeles. School of Engineering and Applied Science.
M. S. Adler, J. Glater, and J. W. McCutchan.
UCLA-ENG-7503, and Water Resources Center Desalination Report No 59, January 1975. 93 p, 15 fig, 11 tab, 35 ref, 6 append.

Descriptors: *Gypsum, *Solubility, *Scaling, *Calcium sulfate, *Saline water, Inorganic compounds, Sulfur compounds, Physical properties, Saturation, Salinity, Water quality, Chemistry, Membrane processes, Sea water, *Desalination, Heat exchangers, Brackish water, Magnesium, Heat transfer.
Identifiers: *Scaling limits, *Calcium sulfate scale, *Scaling thresholds, Modeling solubility, Marshall program, Magnesium augmentation.

Reliable data on gypsum solubility and scaling thresholds are required to establish maximum concentration limits for membrane desalting processes. The solubility of gypsum in natural sea water and agricultural drainage waters was measured at temperatures between 25 and 70 degrees C. Scaling thresholds were evaluated from experimental solubility data by graphical methods. These data were compared with calculated values based on various computation models. Quantitative analysis of water samples provided input data for the computer programs used. A computation scheme based on extended Debye-Huckel theory and experimentally derived constants was used as the basis for this work. The computer program finally developed provides readout of solubilities as well as scaling thresholds for gypsum. The program is practical for engineering use showing a variation of less than 5% from experimentally derived values. The effect of magnesium augmentation on gypsum solubility enhancement was also studied. Magnesium ion is known to significantly increase the solubility of calcium sulfate at elevated temperatures by complexing a portion of dissolved sulfate ion. Routine application of magnesium augmentation to agricultural drainage waters would be limited by economic considerations. (Henley-ISWS)
W75-11473

CALICUM SULFATE SCALING IN REVERSE OSMOSIS (HYPER-FILTRATION) OF BRACKISH WATERS BY HOLLOW-FIBER AND SPIRAL-WOUND MODULES,
Oak Ridge National Lab., Tenn.
R. E. Minturn.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-227 767, $3.75 in paper copy, $2.25 in microfiche. Research and Development Progress Report, Int-OSW-RDPR-73-897, Oct 1973, 163 p, 30 fig, 13 tab, 19 ref, append. DI-14-30-2535.

Descriptors: *Reverse osmosis, *Scaling, Brackish water, *Desalination processes, Filtration, *Membranes, Polarity, *Calcium sulfate, Chemical precipitation, Thermodynamics, Electrolytes, Separation techniques, Waste water treatment.
Identifiers: Hyper-filtration, Polarization, Hollow fiber membranes, Spiral wound membranes.

The objective was to operate hollow-fiber and spiral-wound modules in reverse osmosis of synthetic waters in order to establish a correlation between the practical solubility limits of calcium sulfate as a function of operating conditions and the equilibrium solubility limits that were determined in concurrent work. A subsidiary objective was to organize existing literature data on the free energies of solutions of electrolytes common in natural waters in a manner allowing convenient estimation of osmotic pressures. The results of the experimental program directed to reverse osmosis tests of commercial modules are given, thermodynamic data and procedures for its use are presented and a theoretical discussion of concentration polarization in multicomponent systems is presented.

DESALINATION OF WATER.
Australian Patent 459,735. Issued April 10, 1975. Official Journal of Patents, Trade Marks and Designs, Vol 45, No 11, p 1172, April, 1975.

Descriptors: *Patents, *Desalination, Water treatment, Equipment, Saline water, *Waste water treatment, *Evaporation.

# Field 3—WATER SUPPLY AUGMENTATION AND CONSERVATION

## Group 3A—Saline Water Conversion

A patent was issued for a method of desalination of water. Steps include the feeding of saline water to an evaporator, the feeding of hot waste water to the evaporator, so that the waste water is in a heat exhange relationship with the saline water, the maintaining of a vacuum in the evaporator, and the extraction of condensate from a condenser. The latter is accomplished by means which extract the condensate while maintaining the vacuum in the evaporator through the condenser. The saline water boils in the evaporator and dense saline water is then extracted from the evaporator to maintain the desired level. (Prague-FIRL)

**DESALINATION,**
J. D. Coogan, D. Hastings, and C. K. Toohey.
Australian Patent 460,623. Issued May 1, 1975. Official Journal of Patents, Trade Marks and Design, Vol 45, No 14, p 1566, May 1, 1975.

Descriptors: *Desalination, *Desalination apparatus, *Condensation, *Patents, Saline water.
Identifiers: Coils.

A method of desalination has been patented. Saline water is driven through each of a series of flat helical coils of tube, connected in tandem by a conduit. The direction of the water flow in each coil is from the outside towards the center. Sufficient heat is applied to the coils to form a water/steam mixture having a velocity in excess of 20 ft/sec at the center of the last coil. The water is separated from the steam, and the steam is condensed. (Murphy-FIRL)

**CENTRIFUGAL COMPRESSOR-MELTER FOR DESALINATION OF WATER.**
Australian Patent 460,714. Issued May 1, 1975. Official Journal of Patents, Trade Marks and Design, Vol 45, No 14, p 1587, May 1, 1975.

Descriptors: *Desalination apparatus, *Desalination, Potable water, Brackish water, Saline water, Evaporators, *Patents, Crystallization.
Identifiers: *Centrifugal compressor-melter.

A patent has been issued for a device to prepare potable water from brackish- or salt-water. The device consists of a precooler, an evaporator-crystallizer operatively interconnected with the precooler, an ice-brine separating vessel connected with the evaporator-crystallizer, and a compressor, melter-condenser, and auxiliary cooler. The compressor and melter-condenser are combined into a single unit formed by means of a centrifugal fluid vanes compressor. The compression chamber of the fluid vanes compressor is a melting chamber, and the fluid vanes themselves are formed from a mixture of ice particles and a fluid guided by the jets of the fluid vanes compressor rotor. **INFILTRATION AND RUNOFF FOR SMALL FIELD PLOTS UNDER CONSTANT INTENSITY RAINFALL,**
Hebrew Univ., Rehovoth (Israel). Dept. of Soil and Water Science.
D. Swartzendruber, and D. Hillel.
Water Resources Research, Vol 11, No 3, p 445-451, June 1975. 6 fig, 1 tab, 8 ref, 1 append.

Descriptors: *Infiltration, *Runoff, *Field crops, *Rainfall, Infiltrometers, Soil surfaces, Rainfall intensity, Simulated rainfall.
Identifiers: Field plots, Infiltration flux time curves, Rehovot loamy sand.

A relatively simple infiltration equation was used to express the family of infiltration flux time curves that occurred under constant rate water application (sprinkling or rain) from the time that excess water appeared at the soil surface. The equation was easily integrated for cumulative water excess as a function of time, which in turn allowed taking into account a simplified static surface storage volume to calculate cumulative water runoff. The runoff equation so obtained was tested by means of a sprinking infiltrometer used on plots of 1 sq m and was found to express with good accuracy the measured cumulative plot runoff as a function of time. The field data, taken with a modified Purdue-Wisconsin sprinkling infiltrometer on Rehovot loamy sand, were then utilized successfully for obtaining the ultimate steady infiltration flux, even when the period of measuring transient runoff was less than 1 hour and the total runoff less than 1 cm of water. The value of steady flux so obtained was in good agreement with that found under the condition of continuous ponding of water on the soil surface. (Roberts-ISWS)

Western Regional Research Lab., Berkley, Calif.
USDA Report ARS W-2, February, 1975. 329 p.

Descriptors: *Water harvesting, *Arid climates, *Water yield improvement, *Water supply, *Water storage, *Rainfall-runoff relationships, Water yield, Semiarid climates, Stock water, Water tanks, Surface sealing, Soil compaction, Evaporation control, Storage tanks, Seepage control, Water resources development, Rainfall, Runoff, Computer models, Crop production, *Watersheds(Basins).
Identifiers: Runoff farming, Roaded catchments.

Water harvesting is used to develop local water supplies in remote areas for livestock, wildlife, runoff farming, and domestic use. Various water harvesting and storage techniques along with applications to farming are described in the 30 technical reports herein. The majority of papers discuss results of large scale field experiments and describe different applications to render the runoff area or storage pond impermeable, including economic aspects and practicability of the treatment. **WATER HARVESTING FOR LIVESTOCK IN WESTERN AUSTRALIA,**
Western Australia Dept. of Agriculture Katanning. Soil Conservation Service.
W. J. Burdass.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, US Department of Agriculture, Agricultural Research Service Berkeley, California, Western Region, p 8-26, fig, 1 tab, 1 append, 26 ref.

Descriptors: *Water harvesting, *Arid climates, *Water yield, *Water yield improvement, *Water supply, Semiarid climates, Stock water, Surface water, Subsurface waters, Soil types, Streamflow, Saline water, Water tanks, Drainage system, Flow, Subsurface drainage, Watersheds(Basins), Paving runoff, Channels, Surface sealing, Sealants, Soil sealants, *Australia.
Identifiers: Roaded catchments, Flat batter tanks, Runoff farming.

As groundwater is frequently saline on many farms in Western Australia, agricultural practices often necessitate use of diversions to intercept surface and subsurface flow, or physical or chemical surface treatments to harvest available water. Many farmers rely entirely on harvested water in excavated tanks for cattle. The main methods for water harvesting are contour drains, roaded catchments, and flat batters. Farm catchments deteriorate because of surface weathering and erosion, vegetation growth, and livestock trampling. The roaded catchment is the cheapest of the surface treatments, and is likely to remain the standard surface treatment for water harvest on farms in Western Australia. (See also W75-11801) (Robinett-Arizona)

**ENGINEERING ASPECTS OF WATER HARVESTING RESEARCH AT THE UNIVERSITY OF ARIZONA,**
Arizona Water Resources Research Center, Tucson.
C. B. Cluff.
In: Water Harvesting Symposium, March 26-1974, Phoenix, Arizona, US Department of Agriculture, Agricultural Research Service Berkley, California, Western Region, p 27-39, fig, 3 tab, 16 ref.

Descriptors: *Water harvesting, *Drainage systems, *Linings, *Water storage, *Arid climates, Compaction, Soil compaction, Sodium, Gravels, Channels, Channel flow, Flow, Plastics, Asphalt, Water tanks, Semiarid climates, Reservoir storage, Storage tanks, Evaporation control, Seepage control, Surface sealing, Sealants, Soil sealants, Arizona.
Identifiers: Roaded catchments, Runoff farming.

Water harvesting research indicates that the method of land treatment is determined by the use. Large scale testing of better methods include compacted earth, compacted earth sodium treated

gravel covered plastic, and asphalt-plastic-asphalt-chipcoated. Percent efficiency for each method was found to range from 30-60 for compacted earth, 40-70 for compacted earth sodium treated, 50-80 for gravel covered plastic, and 85-95 for Asphalt-plastic-asphalt-chipcoated. The compacted earth and compacted earth sodium treated are soil dependent and should not be built where soils are difficult to compact. A gravel covered plastic catchment should be considered where soil is not suitable for a compacted earth or compacted earth sodium treated. The Asphalt-plastic-asphalt-chipcoated system would be used where soil is unsuitable for compacted earth, compacted earth sodium treated and gravel covered plastic, or where high efficiency is required. (See also W75-11800) (Robinett-Arizona)
W75-11802

**WATER HARVESTING FOR LIVESTOCK, WILDLIFE, AND DOMESTIC USE,**
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
G. Frasier.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, US Department of Agriculture, Agricultural Research Service, Berkeley, California, Western Region, p 40-49, 6 fig, 3 tab, 7 ref.

Descriptors: *Water harvesting, *Water storage, Water requirements, *Cost analysis, Precipitation(Atmospheric), Runoff, Costs, Reservoir storage, Rainfall, Stock water, Water supply, Domestic water, Surface sealing, Sealants, Soil sealants, Rainfall-runoff relationships, Watersheds(Basins).
Identifiers: Runoff farming.

Water harvesting catchment efficiency is discussed together with the threshold quantity of precipitation required to produce runoff. The efficiency, usually expressed as a percentage of the precipitation as measured by a rain gage, depends on factors such as antecedent soil moisture, storm intensity, and storm duration. Water harvesting costs, a function of unit catchment cost, catchment runoff efficiency, total precipitation and life of the treatment, are tabulated for nine water harvesting treatments. Catchment and storage size relations, which depend on the type of rainfall, are discussed. Suggestions are presented for determination of the relative sizes of catchment and storage, a major problem in designing a useful and economical water harvesting system. (See also W75-11800) (Robinett-Arizona)
W75-11803

**WATER DEVELOPMENT IN MANAGEMENT OF LIVESTOCK AND WILDLIFE ON MOUNTAIN WILDLANDS,**
Wasatch National Forest, Salt Lake City, Utah. Range, Wildlife and Watershed Management.
C. C. Williams.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, US Department of Agriculture, Agricultural Research Service, Berkeley, California, p 50-59, 6 fig, 1 tab, 4 ref.

Descriptors: *History, *Planning, *Water sources, *Water resources development, *Water management(Applied), Livestock, Arid climates, Semiarid climates, Sheep, Cattle, Watersheds(Basins), National forests, Grazing, Range management, Water utilization, Precipitation(Atmospheric), Water law, Water harvesting, Water demand, Surface sealing, Saelants, Soil seals.

A brief history of livestock development on U.S. western rangelands is given. Water problems associated with livestock management are made more complex by extreme precipitation differences from location to location, for example, a range from a dry valley to a wet mountain side. A natural or developed water supply is one of the most important requirements of grazing a mountain watershed, and intensive management is necessary. The critical need for good management is planning development techniques is stressed. (See also W75-11800) (Robinett-Arizona)
W75-11804

**BITUMEN, OIL, AND CLAY SURFACES ON A DEEP SAND TO INCREASE RUNOFF FROM CATCHMENTS FOR EXCAVATED TANKS IN WESTERN AUSTRALIA,**
Western Australia Dept. of Agriculture, South Perth. Soils Div.
I. A. F. Laing, and A. L. Prout.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, US Department of Agriculture, Agricultural Research Service, Berkeley, California, Western Region, p 63-75, 2 fig, 6 tab, 6 ref.

Descriptors: *Stock water, *Water supply, *Water yield improvement, *Water harvesting, *Soil sealants, Storage tanks, Water storage, Soil types, Sands, Semiarid climates, Precipitation(Atmospheric), Surface runoff, Surface sealing, Infiltration, Water proofing, Coatings, Sealants, Soil treatment, *Australia.
Identifiers: Western Australia, Runoff farming.

In the southern coastal areas of Western Australia groundwater is rarely potable and stock water supplies rely on runoff from pastured areas or roaded catchments. Experimentation on runoff improvement was done with eight different soil treatments using bitumen, oil, and clay: Data showed that oil primed plots were significantly better than bitumen, and oil and bitumen together were better than clay treatments. Clay treated surfaces were least affected by stock trampling. Runoff from fuel oil treated catchments was found apparently safe for livestock use. Considerations of cost and runoff percentages show the clay catchments to be most practical. (See also W75-11800) (Robinett-Arizona)
W75-11805

**SOIL TREATMENT WITH SILICONES FOR WATER HARVESTING,**
Dow Corning Corp., Midland, Mich.
E. P. Plueddemann.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, US Department of Agriculture, Agricultural Research Service, Berkeley, California, Western Region, p 76-83, 1 fig, 3 tab, 4 ref.

Descriptors: *Water harvesting, *Arid climates, *Water yield improvement, *Surface sealing, *Soil sealants, Water yield, Coatings, Water supply, Semiarid climates, Soil types, Water tanks, Sealants, Rain water, Runoff, Sands, Rainfall-runoff relationships, Water storage, Rainfall, Polymers, Waterproofing, Costs.
Identifiers: Runoff farming.

Effective treatment of a sandy soil was done with an aqueous spray containing a polymer latex and water repellent. The polymer latex bound the soil and the water repellent caused water to run off. An acrylic and a styrene-butadiene resin looked most promising among commercial polymers tested. A sodium methylsiliconate and a silicone emulsion were effective as water repellents, but the emulsion gave better results and was easier to use. A mixture of styrene-butadiene resin latex and silicone emulsion is stable at 50% solids, and can be diluted with water to about 3% solids for soil application. (See also W75-11800) (Robinett-Arizona)
W75-11806

**CHEMICAL WATER HARVESTING,**
DeJong and Associates, Tucson, Ariz.
R. L. A. DeJong, and T. J. Wallace.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, US Department of Agriculture, Agricultural Research Service, Berkeley, California, Western Region, p 84-92, 3 fig, 1 ref.

Descriptors: *Water harvesting, *Water yield improvement, *Soil sealants, *Surface sealing, *Waterproofing, Water yield, Rainfall-runoff relationships, Runoff, Sealants, Soil surfaces, Seepage control, Arizona, Rainfall, Soil chemical properties, Soil physics, Coatings, Costs.
Identifiers: Runoff farming.

The primary chemical used was F125, a soil sealant manufactured by Trans-continental Research and Development Corporation, Tucson, Arizona. The effect of formula F125 on 13 soil properties was studied along with 12 technical properties of chemical F125. At the end of testing there was no recorded loss of waterproofing, nor any erosion of soil. The water sealing function of the chemical was 100 percent. Using F125 at a ratio of 44 to 1 and application rate of 1 gallon per square yard, cost per acre was calculated to be 1,087.80 dollars. Construction involved in site preparation and application of the chemicals require work of only average complexity and sophistication, which enhances the possibilities of application in remote areas. (See also W75-11800) (Robinett-Arizona)
W75-11807

**PERFORMANCE AND DURABILITY OF SHEET METAL, BUTYL RUBBER, ASPHALT ROOFING AND BENTONITE FOR HARVESTING PRECIPITATION,**
Agricultural Research Service, Akron, Colo. Central Great Plains Field Station.
R. H. Mickelson.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, US Department of Agriculture, Agricultural Research Service, Berkeley, California, Western Region, p 93-102, 3 fig, 2 tab, 11 ref.

Descriptors: *Water harvesting, *Arid climates, *Water yield improvement, *Rainfall-runoff relationships, *Linings, Water yield, Water supply, Surface sealing, Sealants, Soil sealants, Rain water, Runoff, Rain-fall, Rubber elastomers, Coatings, *Asphalt, Soil asphalt, *Bentonite, Colorado, Regression analysis, *Rubber.
Identifiers: Runoff farming, Akron(Colo).

Climate, soils, and topography are important factors to consider when selecting materials for harvesting water in any given area. Climate is the most critical, because materials used on the catchment area must withstand annual variations in climate conditions. Asphalt compounds with and without protective coatings have been used more successfully in the arid Southwestern United States than in the Semiarid west, central and northern Great Plains regions, due to extreme temperature variations in the Great Plains which accellerate deterioration. Five experimental harvesting techniques using sheet metal, butyl rubber, asphalt roofing, soil bentonite mixture and native grass were tested. Average annual volume of water harvested from sheet metal butyl rubber, and asphalt roofing was about 50-55 percent of rainfall whereas the bentonite plot was 19 percent and the check plot was 5 percent. Regression analysis was made on rainfall-runoff relationships. (See also W75-11800) (Robinett-Arizona)
W75-11808

**WATER HARVESTING CATCHMENTS ON INDIAN LANDS IN THE SOUTHWEST,**
Bureau of Indian Affairs, Phoenix, Ariz.
J. V. Chiarella, and W. H. Beck.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, US Department of Agriculture, Agricultural Research Service, Berkeley, California, Western Region, p 104-114, 1 ref.

Descriptors: *Water harvesting, *Arid climates, *Water yield improvement, *Performance, *Stock water, Water yield, Water supply, Surface sealing, Sealants, Soil sealants, Rainfall, Runoff, Rainfall-runoff relationships, Linings, Rubber, Elastomers, Coatings, Asphalt, *Arizona, Maintenance, Water storage, Soil compaction, Seepage, Indian reservations, Livestock, Southwest US, Watersheds(Basins).
Identifiers: Phoenix(Ariz), Runoff farming.

Performance of thirty-two catchments built in the Phoenix, Arizona area is discussed. General procedures for construction of these catchments is presented, explaining techniques for removing the vegetation, smoothing and treating the ground with a soil sterilant, and building the catchment. In most instances, success with the catchments on Indian lands was limited, the blame being placed on some technicians reluctant to accept the practicability of the basins. Maintenance on catchments was often negligible unless actually done by the tribe. (See also W75-11800) (Robinett-Arizona)
W75-11809

**DESIGN AND CONSTRUCTION OF ROADED CATCHMENTS,**
Western Australia Dept. of Agriculture, Moora. Soil Conservation Service.
J. L. Frith.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, US Department of Agriculture, Agricultural Research Service, Berkeley, California, Western Region, p 122-127, 4 fig, 7 ref.

Descriptors: *Water harvesting, *Arid climates, *Water yield, *Water yield improvement, *Water supply, Semiarid climates, Water tanks, Drainage systems, Flow, Surface sealing, Runoff, Surface sealing, Soil types, Rainfall-runoff relationships, Rainfall, Soil surfaces, Soil compaction, Clays, *Australia.
Identifiers: *Roaded catchments, Runoff farming, Western Australia.

Roaded catchments in Western Australia are areas of formed, compacted, parallel ridges of earth made in similar fashion to earth roads. Sites should contain clay soil or subsoil and have a surface slope that allows catchment drains to be alined on correct grades and should not be more than 400 meters above dam. Individual roads vary from 5 to 12 meters wide and 50 to 300 meters long. The depth to clay subsoil and selection of road width and side slope, which will expose adequate amounts of clay to cover the catchment, are very important factors. Catchment surface slope is progressively decreased whereas road side slopes are made as steep as possible. Compaction and smoothing produced by rolling during construction impede weed growth and increase runoff and durability. The period during which catchments can be constructed in Western Australia is restricted to Autumn and spring when moisture conditions are optimum for soil compaction. (See also W75-11800) (Robinett-Arizona)

**DESERT STRIP FARMING--COMPUTER SIMULATION OF AN ANCIENT WATER HARVESTING TECHNIQUE,**
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
G. C. A. Morin, and W. G. Matlock.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona U.S. Department of Agriculture, Agricultural Research Service, Berkeley, California, Western Region, p 141-150, 3 fig, 4 tab, 7 ref.

Descriptors: *Water harvesting, *Water yield, *Strip cropping, *Crop response, *Soil moisture, Runoff, Rainfall-runoff relationships, *Arizona, Rainfall, Water yield improvement, Computer models, Mathematical models, Sorghum, Crop production, Semiarid climates, Dry farming, Analytical techniques.
Identifiers: Runoff farming, Tucson(Ariz), Desert strip farming.

A field study of grain sorghum was made in southern Arizona, using only direct precipitation and precipitation from adjacent untreated water collection areas. A mathematical model of a crop growing under desert strip farming conditions was solved and results compared to actual yields. Rainfall data for 1900-1972 were used in the model to predict long term success of desert strip farming. Model predictions for crop yield were slightly low when soil moisture conditions were good and high when moisture conditions were poor. Data for the Tucson Basin indicate that for a collector area to farmed area ratio of 12 there will be significant production of short-season grain sorghum in 4 out of 5 years with field data supporting the validity of the model. The model also indicates that distribution of rainfall in time and space may be more important than total rainfall. *See also W75-11800) (Robinett-Arizona)
W75-11812

**A COMPUTER MODEL FOR OPTIMIZING DESIGN OF IMPROVED CATCHMENT,**
Western Australia Dept. of Agriculture, Moora. Soil Conservation Service.
J. L. Frith, R. A. Nulsen, and H. I. Nicol.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, U.S. Department of Agriculture, Agricultural Research Service, Berkeley, California, Western Region, p 151-157, 3 fig, 1 tab, 5 ref.

Descriptors: *Water harvesting, *Arid climates, *Water supply, *Water storage, Systems analysis, Stock water, Water tanks, Rainfall-runoff relationships, *Australia, Runoff, Rainfall, Ponds, Simulation analysis, Mathematical models, Analytical techniques, Sheep, Watersheds(Basins), *Computer models.
Identifiers: Runoff farming, Western Australia.

In western Australia, 60 years of daily rainfall records were used to compute daily additions to storage. Combinations of catchment area, dam capacity, and sheep flock size were set up and the application of isocosts to isoquants to determine least cost combinations of dam capacity and catchment area for 1,000 sheep was applied. The value of 7.5 millimeters was chosen to represent the threshold of well-constructed, clay-covered roaded catchments. Results indicate that in the region of Jerramungup, it is likely that sheep could be supplied with water from dams and roaded catchments for about 0.65 dollars per sheep. W75-11813

**SEALING LEAKING EXCAVATED TANKS ON FARMS IN WESTERN AUSTRALIA,**
Western Australia Dept. of Agriculture, South Perth. Soils Div.
I. A. F. Laing.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, U.S. Department of Agriculture, Agricultural Research Service, Berkeley, California, p 159-174, 1 fig, 7 tab, 12 ref, 1 append.

Descriptors: *Water harvesting, *Arid climates, *Water supply, *Water tanks, *Soil sealants, Water yield, Water yield improvement, Semiarid climates, Soil types, Ponds, Watersheds(Basins), Surface sealing, Sealants, Runoff, Water storage, Clays, Sodium, Seepage, Rainfall, *Australia, Leakage, Bentonite.
Identifiers: Runoff farming Western Australia.

Runoff seldom occurs during summer and autumn months, and tanks must hold water for at least 200 days. Farm water supply surveys show that in most districts less than 5 percent of all excavated tanks leak, whereas in some districts over 40 percent leak. Sealing a large tank is cheaper per cubic meter than for a small tank and the following treatments were used: Rivaseal (a thin polyester film and fiberglass mat laminated together), polyethylene sheeting, bentonite, and sodium tripolyphosphate. Maximum tolerable seepage loss was 600 millimeters per 200 days. From water loss data and experience in installation, the Rivaseal offered best prospects for seepage control, although it was most expensive. (See also W75-11800) (Robinett-Arizona)
W75-11814

**STORAGE SYSTEMS FOR HARVESTED WATER,**
Agricultural Research Service, Phoenix, Ariz. Water Conservation Lab.
A. R. Dedrick.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, U.S. Department of Agriculture, Agricultural Research Service, Berkeley, California, Western Region, p 175-191, 3 fig, 39 ref.

Descriptors: *Water harvesting, *Water supply, *Water tanks, *Water storage, *Seepage control, Water yield, Water yield improvement, Soil types, Ponds, Surface sealing, Sealants, Soil sealants, Runoff, Soil surfaces, Soil compaction, Rainfall, Bentonite, Asphalt, Coatings, Elastomers, Rubber, Linings, Storage tanks.
Identifiers: Runoff farming.

Requirements of the water storage system, genera storage considerations, and various modes o water storage are discussed along with specific materials used to produce efficient water storag systems. The best mode or material is dependen on local conditions such as: soils, accessibility re garding personnel, equipment, and materials availabaility of materials, costs, and system lif requirement. Storage requirements must b balanced against quantity of precipitation and re liability of receiving this precipitation. Thirtee different methods of sealing ponds are described Compacted earth, bentonite, chemical additives chemical sealants, membrane and film prefabricated asphaltic plank, hot applied asphal tic membrane, reinforced asphaltic membran plastic film, synthetic rubber, hard surface lining storage bags, and storage tanks. W75-11815

**EVAPORATION SUPPRESSION FOR CON SERVING WATER SUPPLIES,**
Agricultural Research Service, Phoenix, Ari Water Conservation Lab.
K. R. Cooley.
In: Water Harvesting Symposium, March 26-2 1974, Phoenix, Arizona, U.S. Department Agriculture, Agricultural Research Servic Berkeley, California, p 192-200, 2 tab, 18 ref.

Descriptors: *Water harvesting, *Arid climate *Evaporation control, *Reservoir evaporatio *Water conservation, *Reflectance, Water yiel Water yield improvement, Water supply, Semiar climates, Water tanks, Ponds, Water storag Rainfall, Water properties, Albedo, Radiatio Energy transfer, Costs.
Identifiers: Water coloring, Shading, Wind ba fles, Rafts.

A large increase in reflectance by making wa surfaces as light colored as possible can signi cantly reduce evaporation. Four main categor of energy-reducing treatments are discusse coloring the water, floating materials on the wat shading the water, and wind baffles. Contin wax, polystyrene rafts, and butyl rubber are most readily available and practical of the lo cost materials, although wind protection may necessary in some cases. Cost of water saved co

pared favorably with costs of alternative sources. (See also W75-11800) (Robinett-Arizona)
W75-11816

**THE DESIGN OF ROADED CATCHMENTS FOR MAXIMUM RUNOFF,**
Western Australia Univ., Nedlands. Dept. of Civil Engineering.
M. Hollick.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, U.S. Department of Agriculture, Agricultural Research Service, Berkeley, California, Western Region, p 201-220, 17 fig, 2 tab, 7 ref.

Descriptors: *Water harvesting, *Arid climates, *Water yield improvement, *Water supply, *Rainfall-runoff relationships, Water yield, Semiarid climates, Soil types, Surface sealing, Soil sealants, Sealants, Runoff, Clays, Seepage, Rainfall, Australia, Costs, Computer, Computer models, Mathematical models, Channels, Analytical techniques.
Identifiers: *Roaded catchments, Runoff farming, Western Australia.

Development of a method for calculating maximum nonerosive gradients for channels, is presented, as well as computer model studies to find the best catchment shape. Results in Western Australia show that: (1) The best width for plane-sided roads varies from about 1 to 6 meters. (2) Corrugations, or miniroads, on sides of roads are valuable, and in this case, optimum width ranges from about 6 meters to the limits of economical construction. (3) Roads should never by shorter than the length tat gives a square catchment layout, and in many cases should be longer. The best prospects for improving the performance of roaded catchments seems to be in the development of techniques for forming miniroads which increase runoff and give a wide range of acceptable widths to allow the use of standard roadmaking equipment and to enable a subsoil blanket to be obtained. (See also W75-11800) (Robinett-Arizona)
W75-11817

**WATER HARVESTING BY RUNOFF INDUCEMENT FOR IRRIGATION OF AN ALMOND ORCHARD IN A SEMIARID CLIMATE,**
United Nations Development Program, New Delhi (India).
E. Rawitz, and D. Hillel.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, U.S. Department of Agriculture, Agricultural Research Service, Berkeley, California, Western Region, p 223-232, 9 fig, 1 tab, 10 ref.

Descriptors: *Water harvesting, *Sermiarid climates, *Water yield improvement, *Soil sealants, *Crop production, Water yield, Water supply, Surface sealing, Sealants, Runoff, Rainfall, Rainfall-runoff relationships, Sodium, Soil compaction, Aspalt, Crop response, Dry farming, Soil moisture, Water conservation, Soil surfaces.
Identifiers: Runoff farming, *Israel(Negev).

Techniques used to increase runoff include land smoothing and compaction, formation of a sodic crust, and the spraying of asphaltic materials. Crop production and soil moisture measurements show that runoff-farming is possible in this 200 to 250 millimeter(mm) rainfall area of the northern Negev in Israel. Area ratios between contributing and receiving areas of 3:1 to 6:1 provide seasonal accretion in a deep soil profile of well over 600 mm. (See also W75-11800) (Robinett-Arizona)
W75-11818

**YIELD EVALUATION OF MICROWATERSHED AND VERTICAL MULCH SYSTEMS,**
Agricultural Research Service, Fort Collins, Colo.
M. L. Fairbourn.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, U.S. Department of Agriculture, Agricultural Research Service, Berkeley, California, Western Region, p 233-243, 8 fig, 3 tab, 6 ref.

Descriptors: *Water harvesting, *Water yield improvement, *Mulching, *Water conservation, *Soil moisture, Colorado, Runoff, Water yield, Soil sealants, Soil types, Surface sealing, Runoff, Rainfall, Rainfall-runoff relationships, crop response, Crop production, Dry farming, Soil-water-plant relationships, Soil surfaces, *Great Plains, Watersheds(Basins).
Identifiers: Runoff farming.

An experiment on the semiarid Great Plains using 3 main treatments, (vertical mulched, non-mulched, and flat surface microwatershed), is described for improvement of water use efficiency by crops. Water infiltrated readily on the vertical mulched microwatershed, and the treated surface soil stayed dry causing a marked increase in soil water storage. Water saved on vertical mulched treatment appeared to cause an increase in yields ranging from 37 to 150 percent compared with the control treatment. A microwatershed system with a contributing slope to crop area ratio of 3 to 1 appeared to be suitable for the soil type and precipitation at Akron, Colorado. (See also W75-11800) (Robinett-Arizona)

**AN ANALYSIS OF THE EFFICIENCY OF MICROWATERSHED SYSTEMS,**
Agricultural Research Service, Fort Collins, Colo.
H. R. Gardner.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, U.S. Department of Agriculture, Agricultural Research Service, Berkeley, California, Western Region, p 244-250, 4 fig, 1 tab, 3 ref.

Descriptors: *Water harvesting, *Water yield improvement, *Mulching, *Water conservation, *Evaporation control, Colorado, Runoff, Rainfall, Water yield, Soil moisture, Soil water movement, Evaporation, Infiltration, Soil surfaces, Soil water, Plant growth, Soil-water-plant relationships, Great Plains, Watersheds(Basins).
Identifiers: Runoff farming.

A vertical mulched slot placed at the bottom of a watershed slope, caused deeper penetration of water and reduction of evaporation at the Central Great Plains Field Station at Akron, Colorado. Cumulative evaporation was predicated and also determined by initial and final water contents in the soil profile, showing a decrease in evaporative loss of 2.9 centimeters due to the mulch system. There appears to be a potential for decreasing evaporation up to 50 percent. (See also W75-11800) (Robinett-Arizona)
W75-11820

**USING PARAFFIN AND POLYTHYLENE TO HARVEST WATER FOR GROWING SHRUBS,**
Forest Service (USDA), Albuquerque, N. Mex. Rocky Mountain Forest and Range Experiment Station.
E. F. Aldon, and H. W. Springfield.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, U.S. Department of Agriculture, Agricultral Research Service, Berkeley, California, Western Region, p 251-257, 3 fig, 1 tab, 8 ref.

Descriptors: *Water harvesting, *Water yield improvement, *Semiarid climates, Soil sealants, Plant growth, Runoff, Rfall, Rainfall-runoff relationships, Water yield, Surface sealing, Sealants, *Plastics, Soil moisture, Soil-water-plant relationships, Plant physiology, Soil temperature, New Mexico.
Identifiers: Runoff farming, *Wax.

The experiment, conducted at Santa Fe, New Mexico, consisted of installing sheets (9 square feet), of black polyethylene around the stem of the plant, or waterproofing the soil around the plant using paraffin wax. Seventy five days after planting, shrubs grown in plots treated with polyethylene were largest, while those in untreated plots were smallest. Soil temperatures 1 inch deep were higher under paraffin than under polyethylene, and soil moisture was higher under both the paraffin and polyethylene than the untreated plots. A half-pound of ground paraffin per square foot harvested as much water as higher rates of paraffin. (See also W75-11800) (Robinett-Arizona)
W75-11821

**PRECIPITATION ENTRAPMENT FOR EVAPORATION SUPPRESSION,**
Agricultural Research Service, Orono, Maine. Soil, Water and Air Sciences.
J. R. Hoover.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, U.S. Department of Agriculture, Agricultural Research Service, Berkeley, California, Western Region, P 259-268, 4 fig, 6 tab, 18 ref.

Descriptors: *Crop production, *Water harvesting, *Evaporation control, *Water yield improvement, *Soil moisture, Rainfall, Water conservation, Arid climates, Water yield, Water supply, Semiarid climates, Soil sealants, Plant growth, Runoff, Rainfallrunoff relationships, Surface sealing, Sealants, Plastics, Soil-water-plant relationships, Evaporation, Crop response, Crop production, South Dakota, Soil profiles, Soil stabilization.
Identifiers: Runoff farming, Dust control agents, Soil stabilizers.

Soil moisture storage can be increased by precipitation runoff inducement to a concentration level where the rainfall is conducted to a point deep in the soil where it can infiltrate the experiment objective was to determine the amount of moisture from both small and large storms that could be saved by entrapment in the soil profile and used for plant production. Deep placement of precipitation was effective when coupled with a plastic surface sealant while the chemical DCA-70 soil stabilizer and dust control agent was not consistently effective for inducing runoff or for evaporation suppression. W75-11822

**CROP PRODUCTION BY WATER HARVESTING,**
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
D. D. Fangmeier.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, U.S. Department of Agriculture, Agricultural Research service, Berkeley, California, Western Region, p 269-276, 7 tab, 2 ref.

Descriptors: *Water harvesting, *Water yield improvement, *Arid climates, *Water supply, *Crop production, Runoff, Rainfall, Rainfall-runoff relationships, Water yield, Semiarid climates, Soil sealants, Plant growth, Surface sealing, Sealants, Plastics, Soil-water-plant relationships, Crop response, *Arizona, Soil moisture, Water requirements.
Identifiers: Runoff farming.

The feasibility of using runoff water for crop production in southeastern Arizona without water storage facilities is studied. Plots were planted with grain sorghum and four water treatments were used providing each basin with 3, 4, 5, or 6 times the measured rainfall. Planting on the flat or in small furrows appears preferable to deep furrows or beds, and soil leveling can be very critical as low spots will receive more water and give more

growth. Yield data for 4 years indicate that it is possible to produce a crop in this area using water harvesting, however, dry years or years with above-average late-season precipitation can result in little or no production. (See also W75-11800) (Robinett-Arizona)
W75-11823

**RUNOFF UTILIZATION FOR GRAIN PRODUCTION,**
Agricultural Research Service, Bushland, Tex. Southwestern Great Plains Research Center.
O. R. Jones, and V. L. Hauser.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, U.S. Department of Agriculture, Agricultural Research Service, Berkeley, California, Western Region, p 277-283, 4 fig, 1 tab, 10 ref.

Descriptors: *Water harvesting, *Water yield improvement, *Crop production, *Bench leveling, *Contour farming, Terracing, Erosion control, Sorghum, Runoff, Water yield, Rainfall, Rainfall-runoff relationships, Semiarid climates, Plant growth, Sail-Water-Plant relationships, Crop response, *Texas, Soil moisture, Land forming, Soil conservation.
Identifiers: Runoff farming, Conservation bench terraces.

Results are reported of 14 years of research at Bushland, Texas, on conservation bench terraces and bench leveling, and comparison of yields with those from other cropping systems to determine effects of runoff on grain yields. Bench leveling to prevent runoff increased sorghum yields 43%, and conservation bench terraces increased yields 80% over yields obtained on sloping plots that had runoff. Bench leveling had greater farm production than conservation bench terraces because all the land area was cropped continuously but also had an increased probability of poor yields. Only one-third of the conservation bench terraces area needs to be leveled whereas all land area is leveled for bench leveling. (See also W75-11800) (Robinett-Arizona)
W75-11824

**WATER HARVESTING FOR BARLEY IN A 30-CM WINTER RAINFALL AREA,**
California Univ., Riverside.
R. E. Luebs, and A. E. Laag.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, U.S. Department of Agriculture, Agricultural Research Service, Berkeley, California, Western Region, p 284-291, 3 tab, 8 ref.

Descriptors: *Water harvesting, *Rainfall-runoff relationships, *Water yield improvement, *Crop production, *Water supply, Runoff, Rainfall, Water yield, Soil moisture, Soil-water-plant relationships, Plant growth, Water requirements, Plastics, Soil sealants, Surface sealing, Sealants, California, *Barley.
Identifiers: Runoff farming.

In an experimental area with a 1:1 ratio of polyethylene covered runoff surface to collection area, an annual average of 62% of runoff was retained on cropped areas which increased available soil water throughout the growing season. Barley grain production was increased significantly in 1 year of 3 and production with water harvesting was greater 2 or 3 years when compared with the fallow-crop system, which used the same land area. (See also W75-11800) (Robinett-Arizona)
W75-11825

**OPPORTUNITY FOR HARVESTING WATER FROM AND ALONG HIGHWAYS IN RANGELAND AREAS OF WYOMING,**
Agricultural Research Service, Fort Collins, Colo.
C. E. Evans, D. A. Woolhiser, and F. Rauzi.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, U.S. Department of Agriculture, Agricultural Research Service, Berkeley, California, Western Region, p 293-301, 5 fig, 6 ref.

Descriptors: *Water harvesting, *Rainfall-runoff relationships, *Water yield improvement, *Crop production, *Computer models, Runoff, Rainfall, Water yield, Soil moisture, Plant growth, Mathematical models, Analytical techniques, *Wyoming, Highways, Land management.
Identifiers: Runoff farming.

Forage yield observations along a particular highway showed substantially greater production than was observed from adjacent native rangelands. Areas along the highway were harvested with yield estimates ranging from 3 to 8 tons of quality has per mile. Herbage yields could probably be increased susbstanitally with fertilization, land leveling and shaping, better adapted plant species, and improved management. (See also W75-11800) (Robinett-Arizona)
W75-11826

**ESTABLISHING WINDBREAKS IN SEMIARID AREAS BY ALTERING THE MICROCLIMATE OR SUPPLYING ADDITIONAL WATER,**
Agricultural Research Service, Manhattan, Kans.
J. D. Dickerson, and N. P. Woodruff.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, U.S. Department of Agricilture, Agricultural Research Service, Berkeley, California, Western Region, p 302-309, 3 tab, 36 ref.

Descriptors: *Microclimatology, *Water harvesting, *Water yield improvement, *Surface sealing, *Plant growth, Runoff, Rainfall, Rainfall-runoff relationships, Soil sealants, Sealants, Water requirements, Kansas, Solar stills, Mulching, *Scotch pine trees, Wind breaks, *Juniper trees.
Identifiers: Runoff farming, Drip irrigation, Recedar, Shading.

Seven methods were used to supply additional water or alter the microclimate of redcedar (Juniperus virginiana) and Scotch pine (Pinus sylvestris) trees to induce faster growth and higher survival rates. Two water harvest treatments for redcedars produced 32% and 31% more total growth than did a control, and drip irrigation and snow-fence-protected treatments produced 25% and 24% more total growth, respectively. Shaded treatment did not increase growth but resulted in 100% survival compared with 70% for the control. Scotch pines tended to have better survival and total growth in a protected or shaded environment. (See also W75-11800) (Robinett-Arizona)
W75-11827

**MULTIPURPOSE SALT TREATED WATER HARVESTING SYSTEM,**
Arizona Univ., Tucson. Dept. of Soils, Water and Engineering.
G. R. Dutt, and T. W. McCreary.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, U.S. Department of Agriculture, Agricultural Research Service, Berkeley, California, Western Region, p 310-314, 1 fig, 4 tab.

Descriptors: *Water harvesting, *Water yield improvement, *Semiarid climates, *Water supply, *Water conservation, Runoff, Rainfall, Rainfall-runoff relationships, Water yield, Arizona, Soil-water-plant relationships, Plant growth, Crop production, Crop response, Soil moisture, Soil sealants, Surface sealing, Sealants, Sodium chloride, Soil compaction, Seepage, Water tanks, Ponds, Water storage, Evaporation control.
Identifiers: Runoff farming, Tucson(Ariz), Rafts, *Grapes.

The requirements of this system are to collect water for use inside or outside the system, increase the desired production of the land within the system, and provide an esthetically pleasing environment. A salt treated catchment planted with grape vines, with a storage pond for drought periods is discussed. Since December 1971, the tank, which receives about 52% of the rainfall over the catchment has never been dry. Grape vines receive water from the pond during dry periods and have shown good growth. The salt content of the water in the tank at different dates shows that after initial establishment the salt content declines, indicating added chloride is remaining on the catchment. **DIFFERENT SOIL TREATMENTS FOR HARVESTING WATER FOR RADISH PRODUCTION IN THE MEXICO VALLEY,**
Escuela Nacional de Agricultura, Chapingo (Mexico). Dept. of Soils.
M. G. Anaya, and J. S. Tovar.
In: Water Harvesting Symposium, March 26-28, 1974, Phoenix, Arizona, U.S. Department of Agriculture, Agricultural Research Service, Berkeley, California, Western Region, p 315-320, 3 tab, 8 ref.

Descriptors: *Water harvesting, *Water yield improvement, *Surface sealing, *Crop production, *Water supply, Runoff, Rainfall, Rainfall-runoff relationships, Water yield, Soil-water-plant relationships, Plant growth, Sealants, Soil sealants, Crop response, Soil moisture, Soil compaction, Plastics, *Mexico, *Soil treatment.
Identifiers: Runoff farming, Straw, *Radishes.

Five treatments were applied on runoff surfaces: Polyethylene, straw, compacted-earth, compacted-earth-diesel-treated 250 ml per sq m, and compacted-earth-diesel-treated 125 ml per sq m. No significant differences in radish yields were obtained with the 5 treatments and therefore the cheapest of these methods; compacted-earth or compacted-earth-diesel-treated is recommended. The more surface used for runoff, the higher the production of radish obtained on the 3 levels studied. (See also W75-11800) (Robinett-Arizona)

**PREDICTING EXCHANGEABLE SODIU RATIOS IN IRRIGATED TROPICAL VE TISOLS,**
Hawaii Inst. of Geophysics, Honolulu.
S. Sinanuwong, and S. A. El-Swaify.
Soil Science Society of America Proceedings, V 38, No 5, p 732-737, September-October, 1974. fig, 7 tab, 12 ref.

Descriptors: *Sodium, *Hawaii, Soil properti Soil chemical properties, Soil properties, S chemistry, Soil tests, Forecasting.
Identifiers: Sodium exchange, Sodium adsorptio Vertisols.

Batch equilibrium studies were used to investig Na divalent exchange and to derive Gapon c stants for three Hawaii Vertisols. Obtained regr sion coefficient values indicated that a linear re tionship exists between exchangeable sodi ratios (ESR) and sodium adsorption ratios (SA for tropical Vertisols. ESR values obtained for t

of the soils were slightly lower than the values predicted by Bower's equation and higher than those predicted by the U.S. Salinity Laboratory's equation. ESR values obtained for the third soil were lower than those predicted by either equation. Generally, the higher preference of surface than of subsurface horizons for Na was confirmed. Prevailing electrolyte concentration levels were found more important than any other experimental variable in affecting the precision of ESR estimates for a given SAR. Although ESR values were generally higher at 0.1N than at 0.01N, the valence-dilution effect was reversed for the surface horizon of one Vertisol during Mg-Na exchange. While little difference was noted between Ca-Na and Mg-Na exchange in one of the soils, in the other two significantly smaller ESR values were obtained for the first than for the second reaction. An unexpected type of hysteresis effect was noted, whereby divalent-soils exhibited greater preference for Na than did Na-soils. Possible reasons for this effect are discussed. California Univ., Riverside. Dept. of Soil Science and Agricultural Engineering.
C. T. Bernal, F. T. Bingham, and J. Oertli.
Soil Science Society of America Proceedings, Vol 38, No 5, p 777-779, September-October, 1974. 7 fig, 2 tab, 15 ref.

Descriptors: *Wheat, Crop response, Crop production, Germination, *Salinity, *Salt tolerance, Sodium chloride.
Identifiers: *Mexican wheat.

Germination, seedling growth, and grain production of four short-season, one intermediate-season, and three long-season varieties of Mexican wheat were studied in relation to variable NaCl salinity. Germination counts after 7 days exposure to NaCl solutions in petri dishes revealed that the wheats as a group are relatively tolerant, germinating freely in the presence of -16 to -20-atm osmotic potential. Tolerance at germination was not associated with any obvious properties such as length of growing season or seed hardness. The eight wheat varieties were grown from seedling stage to maturity in sand cultures with a complete nutrient solution containing sufficient NaCl to produce total osmotic potentials of 0.5, -2.5, and -5.5 atm. Plots of relative grain yield in relation to osmotic potential of substrate revealed two general relationships, one for the short-season varieties and one for the long-season varieties. **PERFORMANCE OF RICE VARIETIES IN A HIGHLY SALINE SODIC SOIL AS INFLUENCED BY PLANT POPULATION,**
Central Soil Salinity Research Inst., Karnal (India). Div. of Soils and Agronomy.
K. S. Dargan, I. P. Abrol, and D. R. Bhumbla.
Agronomy Journal, Vol 66, No 2, p 279-280, March-April, 1974. 2 tab, 3 ref.

Descriptors: *Salinity, *Saline soils, *Crop response, *Rice, Plant populations, Germination, Alkalinity, Reclamation, *Sodic soils.

It is generally recognized that increased initial plant population or increased seeding rate in saline sodic soils would compensate for decreased germination, and seeding mortality. However, there is little or no experimental evidence of the gains obtained from such a practice. In present investigation, the performance of seven rice varieties at three plant populations in a highly saline sodic soil was studied in the field at the Central Soil Salinity Research Institute, Karnal, India. Varieties tested were the tall indica types 'Jhona 349'; 'Jhona 351,' 'Basmati 217,' and 'Basmati 370' and the semidwarf types 'IR 8,' 'IR8-68' and 'Jaya'. Plant populations used were 2, 4, and 6 transplants/hill. Variety IR 8-68, a local selection from IR 8, with 6 transplants/hill gave the significantly highest grain yield at 57.33 quintals/ha. Variety IR 8 at 6 transplants/hill and Jhona 349 at 4 transplants/hill yielded next in order. Increase in plant population from 2 to 4 and 6 transplants/hill resulted in significantly higher grain yield in all varieties except Jhona 349 where there was a decrease at 6 transplants/hill. Increased yield resulted from increased survival of hills and greater number of panicle-bearing tillers per hill. (Skogerboe-Colorado State)

**IRRIGATION MANAGEMENT FOR SALT CONTROL,**
Agricultural Research Service, Riverside, Calif. Salinity Lab.
J. van Schilfgaarde, L. Bernstein, J. D. Rhoades, and S. L. Rawlins.
Journal of the Irrigation and Drainage Division, Proceedings of American Society of Civil Engineers, Vol 100, No IR3, p 321-338, September, 1974. 8 fig, 5 tab, 27 ref, 2 append.

Descriptors: *Salinity, *Saline soils, Saline water, Irrigation effects, Irrigation practices, Irrigation operation and maintenance, Irrigation water, *Water management(Applied).

Combination of a reevaluation of established crop salt tolerance data, recent advances in understanding of soil chemistry and application of soil physics principles leads to a proposed management system for irrigation that can result in significant reductions in the amount of salt discharged for irrigation projects. These concepts can play a major part in advancing irrigation agriculture, while meeting the challenge of minimizing water quality degradation. Adoption will require changes in irrigation management that call for far closer control of amount and uniformity of water applied than is customary. (Skogerboe-Colorado State)

## 3F. Conservation In Agriculture

**UTILIZATION OF WATER IN A SEMI-ARID REGION,**
New Mexico State Univ., Clovis. Plains Branch Agricultural Experiment Station.
H. D. Fuehring.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-244 880, $3.75 in paper copy, $2.25 in microfiche. New Mexico Water Resources Research Institute, Las Cruces, Report 059, September 1975, 35 p, 23 tab. OWRT B-029-NMEX(1).

Descriptors: *Antitranspirants, *Rain water, Surface runoff, Water conservation, Small watersheds, Moisture stress, *Sorghum, Nitrogen, *Water utilization, Droughts, Dry farming, Arid lands, *Crop production, Southwest US, New Mexico, Wheat.
Identifiers: *Atrozine, Rain-water efficiency, *Southern High Plains(NMex), Sunflower.

A five-year study in the Southern High Plains (annual rainfall of 16 inches) using combinations of bare micro-watershed and growing bed widths resulted in increased crop yields on the growing beds as the proportion of micro-watershed was increased. However, yields for the entire area (including both bed and shed) decreased. Limited work indicated the possibility of also cropping the shed areas and it was concluded that this would be a more practical way of utilizing micro-watersheds. Grain sorghum and sunflowers were successful dryland crops on both beds and sheds while wheat was more suitable as a crop on the sheds rather than on the beds. The use of an antitranspirant (atrazine) gave promising results on grain sorghum but further work is needed. (Hain-New Mexico State)
W75-11356

**EFFECTS OF SOIL TEMPERATURE AND SOIL MOISTURE IN PODDING ZONE ON POD DEVELOPMENT OF PEANUT PLANTS, (IN JAPANESE),**
Ministry of Agriculture and Forestry, Konosu (Japan). Central Agricultural Experiment Station.
Y. Ono, K. Nakayama, and M. Kubota.
Proc Crop Sci Soc Jpn, Vol 43, No 2, p 247-251, 1974. Illus.

Descriptors: *Soil temperature, *Soil moisture, *Peanuts, Plant physiology.
Identifiers: Podding zone, *Pods(Peanuts).

To examine the effects of soil temperature and soil moisture in the podding zone on the pod development of a peanut variety. Chiba-handachi (large seed, semi-erect type), 3 experiments were carried out under the condition separating the podding zone from that in which the roots were grown. In experiment-I, the mean soil temperatures in the podding zone were 38.6 C, 30.6 C, 22.9 C and 15.3 C. Experiment-II was performed under 4 soil moisture conditions, namely 57.3, 40.3, 21.5 and 7.8% of total soil volume. In experiment-III, the effects of the treatments combining high soil temperature (37-39 C) and low soil moisture (6-8%) in the podding zone; every 10 days after the peg penetration, development was examined. The inception and rate of the pod development were affected remarkably by soil temperature. In the podding zone, optimum soil temperature was 31-33 C; minimum soil temperature was 15-17 C; and maximum soil temperature was 37-39 C. The optimum soil moisture content in the podding zone was about 40% of total soil volume, regardless of the soil moisture content in the rooting zone. When the soil moisture content was lower than 40%, the podding percentage and the thickening growth of the pod were reduced, and when it was higher than 40%, only the thickening growth of the pod was reduced. The most critical period in the pod stage is the 1st 30 days, especially 20-30 days after peg penetration.--Copyright 1975, Biological Abstracts, Inc.

**GRAIN SORGHUM EVAPOTRANSPIRATION AND WATER USE EFFICIENCY UNDER TRICKLE IRRIGATION,**
Texas A and M Univ., College Station. Dept. of Agricultural Engineering.
T. A. Howell, and E. A. Hiler.
Presented at 1974 Annual Meeting of the American Society of Agricultural Engineers, June 23-26, 1974. Stillwater, Oklahoma. Paper No 74-2046. 23 p, 5 fig, 3 tab, 38 ref.

Descriptors: *Grain sorghum, *Evapotranspiration, *Irrigation practices, Irrigation systems, Irrigation, Water utilization.
Identifiers: *Trickle irrigation, *Drip irrigation.

Water use efficiency of grain sorghum may be increased by tulizing trickle irrigation to apply frequent, but small irrigation quantities and limiting these applications according to the stage of plant development. Water deficits which occur before the milk to soft dough stage of grain sorghum development can reduce yield and water use efficiency. However, careful regulation of the irrigation quantity to minimize water deficits during those periods can increase water use efficiency. Stage II (boot to bloom) is the most critical period. Utilizing an existing soil water balance model to determine plat transpiration futher reinforced this conclusion when the yield per unit of transpired water was computed. (Skogerboe-Colorado State)
W75-11582

**MOISTURE AVAILABILITY AND CROP PRODUCTION,**
Utah State Univ., Logan. Dept. of Agricultural and Irrigation Engineering.
G. H. Hargreaves.
Presented at 1974 Annual Meeting of the American Society of Agricultural Engineers, June 23-26, 1974. Stillwater, Oklahoma, Paper No 74-4010. 13 p, 1 fig, 2 tab, 7 ref.

Descriptors: *Crop production, *Moisture availability, Moisture deficit, Evapotranspiration, Irrigation, Irrigation design, Methodology.

Although yield data are available for agricultural crops at many locations, there is a scarcity of data relating yield to moisture availabilty. Improved evaluation of the effect of moisture could be accomplished through improved standaridization and more uniformity in reporting procedures. Many interacting factors result in various levels of crop yields. However, there is a surprising degree of uniformity in response to level of moisture availability when data from various experiments are analyzed in a standardized manner. General acceptance of more complete and thorough methods for the quantitative evaluation of moisture deficiencies will improve the valuation of climate as a resource to be considered in development. The methodology given also provides a useful tool for irrigation development planning, irrigation design and the scheduling of irrigation applications. (Skogerboe-Colorado State)

**'CHAMBER METHOD' FOR DRIP IRRIGATION SYSTEM DESIGN AND INSTALLATION PROCEDURES,**
Massachusetts Univ., Amherst. Dept. of Food and Agricultural Engineering.
E. S. Pira.
Presented at 1974 Annual Meeting of the American Society of Agricultural Engineers, June 23-26, 1974. Stillwater, Oklahoma. Paper No 74-2047. 12 p, 6 fig, 2 tab, 6 ref.

Descriptors: *Irrigation design, *Head loss, *Design criteria, Irrigation methods, Flow rate, Irrigation, Agriculture.
Identifiers: *Trickle irrigation, *Drip irrigation.

High pressure water is supplied through a 'quick fill' and pressure reducing means to a low pressure distribution chamber. Relatively uniform pressure along the length of the chamber produces relatively uniform flow from the drippers. System designs, components, and installation procedures based on laboratory and field tests are discussed. Darcy's pressure loss equation and Bernoulli's flow equation provide a basis for design. The chamber method irrigation systems. Drippers with tubing segments attached as described eliminate dripper failure problems. The chamber must be charged rapidly for efficient system operation. The diameter of the chamber is a determining factor which limits the number of drippers that can be used and the maximum chamber length. Relatively uniform pressures can be maintained from the beginning to the end of a chamber, at low flow rates. Consequently, flow from the drippers is relatively uniform. Flow rate from the drippers can be adjusted by changing the pressure in the chamber. (Skogerboe-Colorado State)

**OMPARING TRICKLE, SUBSURFACE AND PRINKLER IRRIGATION SYSTEMS,**
outh Dakota State Univ., Brookings. Water esources Inst.
D. Brosz, and J. L. Wiersma.
esented at 1974 Annual Meeting of the American ociety of Agricultural Engineers, June 23-26, 74. Stillwater, Oklahoma, Paper No 74-2045. 16 5 fig, 7 tab, 4 ref.

escriptors: *Subsurface irrigation, *Sprinkler irrigation, Irrigation systems, Crop response, rn(Field), Potatoes, Irrigation efficiency.
entifiers: *Trickle irrigation, Drip irrigation.

ree years of data were collected on yield sponses of potato and hybrid corn crops irated by trickle, subsurface, and sprinkler irrigan systems. The study was conducted on field ots which included six irrigation system design atments that were replicated three times. The sign treatments included every row and every ter row trickle and subsurface irrigation, small quent sprinkler application, and larger, less quent sprinkler applications. Potato and corn oduction could be increased by 5 to 15 percent h 20 percent less water applied through the use trickle and subsurface irrigation. A water ings of 30 to 40 percent could possibly be hieved with trickle and subsurface irrigation for lds that are essentially the same as those obed with sprinkler irrigation. Trickle and subface irrigation systems allow for a more effint water management operation. Tensiometers talled in the research plots showed that the soil ter tension was higher for the trickle and subface plots. The irrigation system design treatnts had no effect on potatoe crop maturity or lity. The sprinkler irrigation system design that plied small, frequent water depths did have an ect on the grain quality of a corn crop in that ck masses of spores appeared on the ears of the n plant. **NITRIFICATION AND DENITRIFICATION DURING MISCIBLE DISPLACEMENT IN UNSATURATED SOIL,**
California Univ., Davis.
C. Kirda, J. L. Starr, C. Misra, J. W. Biggar, and D. R. Nielsen.
Soil Science Society of America Proceedings, Vol 38, No 5, p 772-776, September-October, 1974. 5 fig, 1 tab, 15 ref.

Descriptors: *Nitrification, *Denitrification, *Leaching, Diffusion, Soil water, Soil properties, Soil chemistry, Unsaturated flow.
Identifiers: Microbial growth, Nitrogen transformations.

Nitrification and denitrification during the leaching of a pulse of NH4NO3 applied to the surface of soil columns are analyzed experimentally and theoretically. Experimentally, unsaturated soil columns of two lengths were leached steadily with a trace solution containing NH4NO3 while the air-filled portions of the columns were being flushed simultaneously with air. During these steady state conditions, a pulse of tracer solution containing either 15NH4(+) or 15NO3(-) was leached through the columns. The words tracee and tracer signify that both solutions were chemically identical with the latter containing a greater proportion of 15N. Steady-state tracee concentration distributions within the columns as well as the transient tracer concentration distributions in the effluent were analyzed assuming first-order kinetics. Values of both the rate coefficients and the concentration distributions stemming from the tracee and tracer measurements were in general agreement. The agreement between the measured and theoretical results are discussed in terms of soil water properties and the kinetics of microbial populations. (Skogerboe-Colorado State)

**RICE RESPONSE TO NITROGEN AND PHOSPHORUS IN FLOODED AND NONFLOODED SOILS,**
National Fertilizer Development Center, Muscle Shoals, Ala.
G. L. Terman, and S. E. Allen.
Soil Science Society of America Proceedings, Vol 38, No 5, p 780-784, September-October, 1974. 3 fig, 5 tab, 12 ref.

Descriptors: *Rice, *Nitrogen, Nitrification, *Phosphorus, *Crop response, Greenhouse, Flood irrigation, Flooding.

Pot experiments were conducted in a greenhouse to study nutrition of rice under flooding and upland conditions. Yields of rice grown in one experiment on Mountview silt loam increased rectilinearly with 0-, 400-, and 800-mg rates of N/pot (5 kg of soil). Concentrations of N in grain + straw at maturity were uniformly low. Multiple rates of N from 250 to 2,000 mg/pot and P from 0 to 1,000 mg/pot (6.25 kg of soil) were applied for Nato rice grown on Mountview silt loam and Sango silty clay loam in a second experiment. Marked yield responses to N and P were obtained. Yields of straw and of grain + straw, N uptake, and N recovery were higher on nonflooded than on flooded soils. Grain yields, however, were slightly higher with flooding. Uptake of N, P, Ca, Mg, Mn, and Zn increased with yield response to N and P, while K uptake decreased on the Mountview soil. Concentrations of N and P increased with applied N and P, respectively, while concentrations of other nutrients were diluted in most situations with yield response to N or P on both flooded and nonflooded soils. These results indicate that with adequate applied nutrients, especially N, yields of rice with adequate water but without flooding can equal or even exceed those under flooding. **COMPARATIVE EFFICIENCY OF SOLUBLE AND CONTROLLED-RELEASE SULFUR-COATED UREA NITROGEN FOR CORN IN TROPICS,**
University of the West Indies, St. Augustine (Trinidad).
R. C. Dalal.
Soil Science Society of America Proceedings, Vol 38, No 6, p 970-974, November-December, 1974. 3 fig, 5 tab, 11 ref.

Descriptors: *Nitrogen, *Urea, *Nitrification, *Corn(Field), Crop response, Nutrients, Absorption.
Identifiers: Ammonium sulfate, Urea-ammonium phosphate, Nitrogen uptake.

The efficiency of the soluble-N sources, ammonium sulfate (AS), urea-ammonium phosphate (UAP) and urea and controlled-release-N source, sulfur-coated urea (SCU-8.9, SCU-1.1, and SCU-0.9) of differing N-release rates applied at 50, 100, and 200 kg/ha of N to an acidic soil, were compared in terms of N uptake and grain yield of corn. The apparent N recovery of added N, calculated by uptake differences from the control plots, was evaluated from N uptake by the two successive crops, one in the wet season and the other in the following dry season. In general, N uptake, grain yield, and apparent N recovery were increased by added N; which was opposite to the nitrification of these N sources except that the performance of urea was better than the other soluble-N sources, primarily because it had a smaller effect on soil pH and exchangeable Al. The inclusion of microbicide in the S-coatings of SCU had no influence on N efficiency or grain yield. More N was recovered from SCU with slower N-release characteristics irrespective of coating weight. Apparent recovery of added N was almost complete from urea, SCU-8.9, SCU-1.1 and SCU-0.9 when applied at the rate of 50 kg/ha of N, although the recovery at 200 kg/ha of N was about 50%. (Skogerboe-Colorado State)

**RELATION BETWEEN NITRATE ABSORPTION AND WATER TRANSPIRATION BY CORN,**
North Carolina State Univ., Raleigh. Dept. of Soil Science.
C. F-H. Liao, and W. V. Bartholomew.
Soil Science Society of America Proceedings, Vol 38, No 3, p 472-477, May-June, 1974. 5 tab, 17 ref.

Descriptors: *Nitrates, *Absorption, *Transpiration, Leaching, Corn(Field), Crop response, Evapotranspiration, Diffusion.

The relationship between the absorption of NO3-N by young corn plants and the quantity of water transpired was studied in solution and soil culture. Tracer N was employed to measure NO3 absorption. Gravimetric methods were used to monitor evapotranspiration. From solution culture, NO3 was absorbed at rates relatively greater than water. From soil culture, NO3 was absorbed at a relative rate close to that of water when the soil was not pretreated. However, when the soil material was wetted and leached of soluble N before planting corn, NO3 was absorbed at a relative rate 1.5 to 2.0 times that of water. In soil situations where water was not being absorbed by plants, NO3-N likewise was not absorbed. Mass flow and diffusion both were involved in NO3 transport to roots. Prior cultural conditions had a marked influence on active uptake of NO3 presumably through an influence on specific rates of N absorption. (Skogerboe-Colorado State)

**EFFECTS OF WATER MANAGEMENT AND SOIL AGGREGATION ON THE GROWTH AND NUTRIENT UPTAKE OF RICE,**
California Univ., Davis. Dept. of Agronomy and Range Science.
A. J. Obermueller, and D. S. Mikkelsen.
Agronomy Journal, Vol 66, No 5, p 627-632, September-October, 1974. 5 tab, 20 ref

Descriptors: *Water management(Applied), *Soil aggregates, Crop response, *Nutrients, Nutrient requirements, *Rice, *Crop production, *Flood irrigation, Surface irrigation, Irrigation practices, Root distribution, *Absorption.

Flooding is considered essential for the optimum growth and yield of rice (Oryza sativa). The benefits of flooding are not well understood, even though they have been associated with a reduction in soil moisture stress, alteration of root development, increased availability of plant nutrients, control of weeds, and a modified micro-climate environment. Since modification of soil aggregation may also influence some of the same plant responses as flooding, these effects were examined. The growth and development of rice, cv 'Calrose,' was closely observed from seedling stage to maturity in a controlled greenhouse environment. At harvest the yield components, total yield of grain and straw, root production and distribution, and total uptake of N, P, K, Ca, Mg, Mn, An, Fe, and Si were determined. Rice plants grown under flooded conditions were superior to nonflooded plants except for the first 40 days after planting. Soil aggregation had little effect on the growth and development of flooded rice, but normal flooded rice was benefited by the puddled soil. (Skogerboe-Colorado State)

**BASIC PRINCIPLES OF PULSE IRRIGATION,**
Technion-Israel Inst. of Tech., Haifa. Dept. of Agricultural Engineering.
D. Karmeli, and G. Peri.
Journal of the Irrigation and Drainage Division, Proceedings of American Society of Civil Engineers, Vol 100, No IR3, p 309-319, September, 1974. 2 fig, 3 tab, append.

Descriptors: *Irrigation systems, *Irrigation practices, Irrigation effects, Irrigation design, Sprinkler irrigation, *Application methods, Water conservation.
Identifiers: High frequency irrigation, *Pulse irrigation, Trickle irrigation, Drip irrigation.

The term pulse irrigation was defined qualitatively and quantitatively. This irrigation technique is described in terms of its main purpose which is achievement of low application rate with the help of an irrigation device having a higher application rate. The present analysis based on mathematical and engineering considerations enables the determination of the characteristics of pulse irrigation (e.g., length of operating and resting time in a single pulse and the number of pulses). **NTITY AND FREQUENCY OF TRICKLE FURROW IRRIGATION FOR EFFICIENT BAGE PRODUCTION,**
ultural Research Services, Phoenix, Ariz. r Conservation Lab.
Bucks, L. J. Erie, and O. F. French.
nomy Journal, Vol 66, No 1, p 53-57, Janua- bruary, 1974. 4 fig, 3 tab, 9 ref.

riptors: *Crop production, Crop response, sumptive use, Evapotranspiration, Irrigation ices, Irrigation systems, Irrigation efficiency, tion, Agriculture.
ifiers: *Trickle irrigation, *Drip irrigation, page.

Trickle irrigation, with its capability of small, frequent irrigation applications, has aroused considerable interest because of possible increased production and decreased water requirements. For this reason, a replicated field investigation was conducted to evaluate quantity and frequency of trickle, modified-furrow, and standard-furrow irrigations on the growth of cabbage, using a moderately saline water on a fine-textured soil. Trickle and modified-furrow irrigation were scheduled to supply various quantities of water based on ratios of the plant's estimated consumptive use at frequencies of 3, 6, and 12 days. Recorded data included yield, quality of production, and water-use efficiency. Results indicate that the consumptive-use requirement (38 cm of water in 1972) for high production of cabbage was about the same for all irrigation methods. Trickle and modified-furrow irrigation, however, did reduce furrow irrigation, showing that higher irrigation efficiencies can be attained with these new irrigation methods as opposed to conventional methods. **CHOICE OF IRRIGATION TIMING INDICATOR FOR NARROW ROW COTTON,**
Kansas State Univ., Colby. Colby Branch Experiment Station.
D. G. Bordovsky, W. R. Jordan, E. A. Hiler, and T. A. Howell.
Agronomy Journal, Vol 66, No 1, p 88-91, January-February, 1974. 4 fig, 3 tab, 17 ref.

Descriptors: *Soil moisture, Soil-water-plant relationships, Water management(Applied), Irrigation efficiency, *Irrigation practices, Irrigation, Soil water potential, *Cotton.

This irrigation study was undertaken to compare water use efficiencies (WUE) resulting from three methods of timing water applications on narrow-row cotton. Irrigation timing during the 1971 and 1972 growing seasons was accomplished using the soil water potential (SWP)-fixed level, leaf water potential (LWP)-fixed level, and stress day index (SDI)-variable level of LWP, based on crop sensitivities, as indicators. Specific levels of each indicator were selected so that nearly identical yields would result for all three timing indicators, thus making possible the valid comparison of WUE. With the SWP indicator as a basis for comparison, higher WUE were obtained with the LWP and SDI indicators in both years. At a plant population of 150,000 plants/ha average increases in WUE (seed cotton yield divided by irrigation plus rainfall amounts) were 17 and 38% for the LWP and SDI indicators, respectively. These results demonstrate that significant benefits in stretching irrigation water supplies are possible when using plant-based measurements and when plant sensitivities at different growth stages are quantitatively considered in timing irrigations. **EVAPOTRANSPIRATION BY SUBIRRIGATED ALFALFA AND PASTURE IN THE EAST CENTRAL GREAT PLAINS,**
Nebraska Univ., Lincoln. Dept. of Horticulture and Forestry.
B. L. Blad, and N. J. Rosenberg.
Agronomy Journal, Vol 66, No 2, p 248-252, March-April, 1974. 4 fig, 4 tab, 14 ref.

Descriptors: *Evapotranspiration, *Subsurface irrigation, *Alfalfa, Pastures, Irrigation practices, Irrigation, Nebraska, Latent heat, Advection, Energy budget, *Great Plains.

Evapotranspiration (ET) rates from subirrigated alfalfa pasture were obtained to provide an estimation of the upper and lower limits of water demand for crops growing in climatic regions characterized by strong advection of sensible heat. Results of this study showed that ET rates were 20 to 25% lower in pasture than in alfalfa. These differences are much larger than any previously reported in the literture. Advected sensible heat supplied about 20% of the total energy consumed in the latent heat flux (LE) from alfalfa for the entire study and as much as 40% on certain days. In the pasture, however, with few exceptions, sensible heat was generated rather than consumed. (Skogerboe-Colorado State)

**EFFECT OF PREPLANT-ONLY IRRIGATION ON COTTON YIELDS,**
Texas A and M Univ., Lubbock. Agricultural Research and Extension Center.
J. D. Bilbro.
Agronomy Journal, Vol 66, No 6, p 833-834, November-December, 1974. 1 fig, 4 ref.

Descriptors: *Plant growth, *Crop response, *Cotton, Irrigation practices, Planting management, Irrigation, Dry farming, Irrigation effects.

Irrigation practices for cotton are changing on the Texas High Plains because the irrigation water supply is declining. The objectives of this study were to calculate yield probabilities for cotton planted on both early and late dates and grown with only a preplant irrigation, and then to compare these yield probabilities with those previously calculated for dryland conditions. Yields from early and late plantings that had received only a preplant irrigation for the period 1960 through 1971 were used for calculating probabilities for various yield levels. The expected average yields (50% probability) of the early and late plantings of preplant-irrigated cotton are 530 and 503 kg/ha, respectively; and about 70% of the time the respective yields will differ by less than 50 kg/ha. Thus, the yield potential of preplant-irrigated cotton was not greatly affected by a wide range of planting dates. Also, 50% of the time preplant-irrigated land can be expected to yield about twice as much as comparable dryland and to vary much less in year-to-year yields. (Skogerboe-Colorado State)

**VARIATION IN EFFECTIVENESS OF SUPPLEMENTAL IRRIGATION ON SWEET CORN YIELD COMPONENTS,**
Wisconsin Univ., Madison. Dept. of Agronomy.
R. H. Andrew, and G. G. Weis.
Agronomy Journal, Vol 66, No 3, p 345-350, May-June, 1974. 1 fig, 7 tab, 14 ref.

Descriptors: *Supplemental irrigation, *Crop response, *Sweet corn, Irrigation efficiency, Moisture availability, Moisture tension, Crop production, *Central US.

Supplemental irrigation is of increasing importance in the production of processing sweet corn in the humid Midwest. However, wide variation exists for efficiency of irrigation as related to uniformity and quality as well as yield of this crop. The present study was planned to measure the response of major sweet corn yield components to, and their interaction with, irrigation level as related to genotype, plant competition, and season and to provide guidelines for optimum production practice. Six hybrids were grown at three populations (39,000 49,000 and 59,000 plants/ha) under low and high irrigation levels on droughty sand in central Wisconsin over a 9-year period. Measurements were made of snapped weight, weight and number of usable husked ears, and percent of usable ears expressed on a weight and a number basis. (Skogerboe-Colorado State)

Identifiers: Watershed parameters, Number of wetness curve.

The Soil Conservation Service approach of soil-cover complex concept was modified and refined for predicting runoff volumes from individual storms. Two definitions of runoff volume were examined. For each definition two approaches were investigated: (1) predicting runoff volume with soil-cover information and the SCS rainfall-runoff model, and (2) correlating runoff volumes with climatic and watershed parameters. The first approach required calibration of watershed wetness while the second used a direct correlation. Prediction equations were developed with 210 events from 15 Pennsylvania and Ohio watersheds less than 20 sq miles. Both approaches were tested on the 5 reserved watersheds with satisfactory results. The first approach was found superior to the second. The frequency distribution of watershed wetness associated with flood events was also presented. (Lardner-ISWS)

CER COUNTY SURFACE WATER URCES,
s Dept. of Conservation, Springfield. Div. of ries.
Pulley.
ary 1972. 83 p, 14 fig, 13 tab, 27 ref, 8 ap-

iptors: *Water resources, *Surface waters, ois, *Data collections, Lakes, Ponds, Reser-Recreation, Streams, Reservoir sites, Geomorphology, Climatic data, Geology, Soil texture.
Identifiers: *Mercer County(Ill).

Mercer County, located in northwestern Illinois along a 23.2 mile stretch of the Mississippi River, has an area of 555 square miles and a population of 17,294 (1970 census). The drainage pattern is composed of 4 major and 2 minor stream systems that flow directly into the Mississippi River. The natural drainage system has been altered only along the Mississippi River floodplain where ditches and levees have been constructed and several streams have been dredged and straightened. Including the Mississippi River, there are 167.5 miles of flowing water. The county has 502 impoundments larger than 0.1 acre, for a total of 1198.4 acres. Of these, 415 have been artificially created while 87 are of natural origin. The largest body of public water is the 1400 acres of interlocked sloughs, marshes, and pools of the Kethsburg Wildlife Refuge. New water is added at a rate of 8.3 impoundments per year averaging 2.5 acres each. Nine potential reservoir sites have been identified which would have impoundment surface areas ranging from 90 to 5000 acres. (Humphreys-ISWS)

August 1972. 68 p, 18 fig, 7 tab, 25 ref.

Descriptors: *Water resources, *Surface waters, *Illinois, *Data collections, Water quality, Water pollution, Streams, Rivers, Lakes, Reservoirs, Nitrates, Hardness(Water), Recreation, Geomorphology, Climatic data, Geology, Soil texture, Fishing, Ponds, Boating, Fish.
Identifiers: *Vermilion county(Ill).

Vermilion County, with a population of 97,047 (1970 census), is located on the eastern border of Illinois about 140 miles south of the Illinois-Wisconsin line and has an area of 898 square miles. Natural streams and drainage lines are well established, although a number of flat areas had to be artificially drained before they could be farmed. The county is drained for the most part by the Vermilion River and its tributaries. The southern one-fifth of the county drains directly to the Wabash River via the Little Vermilion River. The total impoundment acreage is 1668.35 acres. In addition, there are 164.2 miles of major streams, with a surface area of 1002.8 acres. Of the total impoundment acreage, 11.0% is state owned, 3.3% is public, 34.2% is organizational, 0.7% is fee fishing, and 50.8% is private water. The most important recreational lakes of the county are those of Kickapoo State Park. There are 8 potential impoundment sites. If the proposed Middle Fork Reservoir project is completed, its will expand the impounded water area of the county 200% and the amount of publicly-available water by 1000%. Water pollution is severe and in certain instances parts of some streams are so degraded that they no longer support fish life. Sources of pollution in the county are agricultural, industrial, and municiple. (Humphreys-ISWS)
W75-11623

**LAWRENCE COUNTY SURFACE WATER RESOURCES,**
Illinois Dept. of Conservation, Springfield. Div. of Fisheries.
R. E. Fisher, and H. P. Brown.
November 1971. 54 p, 13 fig, 8 tab, 24 ref.

Descriptors: *Water resources, *Surface waters, *Illinois, *Data collections, Streams, Water quality, Climatic data, Soil texture, Fishing, Ponds, Fish, Recreation, Geology, Water pollution.
Identifiers: *Lawrence County(Ill).

Lawrence County is 239,360 acres in size and located on the southeastern edge of Illinois. The estimated population is 18,000 people (1971). There are currently 633 artificial impoundments comprising a total of 530.45 surface acres of water. Approximately 64% of the water acreage is classified as ponds (under 6.0 acres in size). Seven areas classified as either 'State', 'Public', or 'organizational' waters total 117.7 surface acres. In addition to the artificial impoundments, there are 11 natural or oxbow lakes totaling 62.90 acres. There are three major streams which are considered to have a fishing resource: Raccoon Creek, Embarras River, and Wabash River. They comprise a total of 2196 surface acres or 64 stream miles. There are several locations for impoundments up to 10 acres in size that could be developed for public or private use, but there is only one area that will impound over 100 surface acres of water. (Humphreys-ISWS)
W75-11624

**DE KALB COUNTY SURFACE WATER RESOURCES,**
Illinois Dept. of Conservation, Springfield. Div. of Fisheries.
G. J. Tichacek, and H. L. Wight.
December 1971. 72 p, 16 fig, 20 tab, 66 ref, 1 append.

Descriptors: *Water resources, *Surface waters, *Illinois, *Data collections, Water quality, Water pollution, Streams, Lakes, Ponds, Hardness(Water), Recreation, Geomorphology, Climatic data, Geology, Soil texture, Fishing, Boating.
Identifiers: *De Kalb County(Ill).

De Kalb County, covering a total of 636 square miles, is on the extreme south-western fringe of the 'Northeastern Illinois Metropolitan Area'. It has a population of 71,654 (1970 census). Surface drainage is divided between the Rock and Illinois River basins by the Cropsey lobe of the Bloomington-Cropsey Morainal System. There are a total of 11 lakes 6.0 acres and larger (including the proposed Shabbona Lake) and 143 ponds, inundating a total of 550.3 acres. There are also 17 permanent streams, the surface area of which covers 617.4 acres. The combined impoundments and stream data provide a grand total of 171 water areas covering 1167.7 acres. The combined length of all named streams is 247.8 miles. The soils were derived from parent materials which were distributed by three agents: ice, water, and wind. Of the parent materials, glacial till was by far the more important in the formation of the present soils. Till of various origins is within 20 feet of the surface over 90% of the county. Most of the tills are quite distinctive, having definite color and texture. Because of surface relief patterns and farming very close to the stream bank, siltation is a major problem in the county streams. Water areas are not grossly polluted at this time; however, there have been numerous reports of pollution occurrences in the county streams over the past 20 years. The limited data available for chemical quality of surfaces waters show that alkalinities averaged 307.4 ppm for the 17 streams sampled and 161.0 ppm for the impoundments. Hardness concentrations ranged from 478.0 ppm to 649.4 ppm and averaged 556.6 ppm for 11 of the streams. (Humphreys-ISWS)

fects, Vegetation regrowth, Vegetation establishment, Germination, Canals, Channeling, Structures, Drawdown, Environmental effects, Herbicides, Burning, Aquatic plants, Marsh plants, Aquatic weed control, Environment, Flood control.
Identifiers: *Kissimmee River(Fla).

The Central and Southern Florida Flood Control Project in the Kissimmee River Basin consisted of enlarging existing canals connecting the upper chain of lakes, installing water control structures in several of these canals, and channelizing and providing control structures in the river proper (which extends from Lake Kissimmee to Lake Okeechobee). One major canal, designated C-38, was constructed within the Kissimmee River floodplain. Six regulatory structures were situated along the canal to control the drop in elevation. Stabilization of the water level in the impoundment area behind the regulatory structures since January 1969 has had a pronounced impact on the vegetational composition of the marshes. The lack of seasonal fluctuation has resulted in the dominance of terrestrial plants in the north end of the impoundment, the dominance of aquatic plants in the south end of the impoundment, and the inhibition of growth for most aquatic annuals. When competition was eliminated or reduced substantially and the underlying substrate was exposed during a drawdown, many additional species of both annual and perennial plants germinated and flourished. **AGRICULTURAL DRAINAGE RESEARCH NEEDS AND PRIORITIES, 1974,**
Agricultural Research Service, Baton Rouge, La.
C. E. Carter, W. W. Donnan, I. G. King, and G. O. Schwab.
Transactions of the American Society of Agricultural Engineers, Vol 18, No 3, p 529-534, May-June 1975. 1 fig, 3 tab.

Descriptors: *Research priorities, *Drainage, *Agriculture, Surface drainage, Subsurface drainage, Channels, Outlets, Humid areas, Arid lands, Surveys, Planning.

Drainage research has played an important role in increasing food and fiber production in the United States. In the future its importance is expected to increase as farmers attempt to increase crop yield per acre to meet the increased demands for food and fiber both at home and abroad. Results of a survey made during 1973 to 1974 to determine drainage research needs in the United States was reported. Agencies in each state within the United States were contacted and requested to list drainage research needs. The agencies included the Soil Conservation Service, Agricultural Research Service, Water Resource Research Institutes, Agricultural Experiment Stations, Cooperative Extension Service, and Bureau of Reclamation. Responses were compiled separately for humid and arid (irrigated) states for three categories: (1) subsurface drainage, (2) surface drainage, and (3) channels and outlets. Responses were further subdivided within each of these categories for 13 different research needs. The research needs cited most frequently in the survey (in decreasing order of priority) were: water quality, design, materials, and economics for the subsurface drainage category; water quality, environment, design, and economics for the surface drainage category; and design, environment, water quality, economics, and minatenance for the channels and outlets category. (Sims-ISWS)

**HYMO FLOOD ROUTING,**
Agricultural Research Service, Temple, Tex.
J. R. Williams.
Journal of Hydrology, Vol 26, No 1/2, p 17-27, July 1975. 7 fig, 2 tab, 7 ref.

Descriptors: *Flood routing, *Rainfall-runoff relationships, *Synthetic hydrology, Flood forecasting, Flood control, Flood protection, Hydrographs, Floods, Computer programs.
Identifiers: *HYMO computer program, *Variable Travel Time(VTT) flood routing.

The Variable Travel Time (VTT) flood routing method was developed to account for the variation in travel time with stage and water-surface slope. The VTT method is suited for HYMO, a problem-oriented computer language for building hydrologic models, because it requires little computer storage, routes both channel and floodplain flows, performs reliably under widely varied conditions, and given consistent results over a wide range of routing intervals and reach lengths. Although the solution is iterative, the VTT method requires little computer time and is free of convergence problems often encountered in more complex routing methods. By accounting for the variation in water-surface slope, the VTT method yields results that are comparable to the accurate results obtained with an implicit solution of the unsteady flow equations of continuity and motion. Yet the VTT method has the general applicability of storage methods. The use of the VTT method makes HYMO a useful and versatile model for water resources planning, water quality modeling, and hydrologic research. (Jess-ISWS)

**APPLICATION OF A GENERALISATION OF WALD'S IDENTITY TO SOLVING CERTAIN MULTI-STREAM STORAGE PROBLEMS,**
Monash Univ., Clayton (Australia). Dept. of Mathematics.
N. S. Barnett.
Journal of Hydrology, Vol 26, No 1/2, p 95-113, July 1975. 27 ref, 2 append.

Descriptors: *Stochastic processes, *Reservoir operation, *Markov processes, Synthetic hydrology, Systems analysis, Mathematical studies, Operations research, Reservoir storage, Reservoir releases, Streamflow, Dams, Flow control.
Identifiers: *Wald's identity, Random walk process.

The development of Wald's identity was traced with special reference to its application in solving storage problems. Research was specifically concerned with the problem of regulating the flow of water below the confluence of two streams by means of a dam built across one of them. Considering a model in which flows in the streams form independent Markov chains, expressions for the probability of emptiness and for p.g.f. of the time to first emptiness were obtained using a Markovian extension of Wald's identity. Descriptors: *Density currents, *Froude number, *Flow profiles, *Gradually varied flow, Energy, Hydraulics, Analysis, Reservoirs, Density, Open channel flow, Equations, Underflow, Shear stress, Slopes, Interfaces, Depth.
Identifiers: *Plunging flow, One-dimensional analysis, Two-layer flow, Plunge line.

The plunging of denser inflow water into a reservoir was analyzed by two approaches. A simple energy conserving flow analysis yielded the depth at the plunge point. A gradually varied two-layer flow analysis gave the depth at the plunge point and predicted the interfacial profile for cases with resistance and sloping beds. Both analyses were compared with experimental results reported by other investigators. (Adams-ISWS)

**BALANCING RESERVOIR--A KEY ELEMEN IN WATER SUPPLY PLAN,**
Freese and Nichols, Fort Worth, Tex.
I. B. Freese
Public Works, Vol 106, No 5, p 104-105, Ma 1975. 1 fig.

Descriptors: *Water supply, *Pipeline *Reservoirs, Rivers, Water treatment, Facilitie Construction materials, Synthetic rubber, *Texa
Identifiers: *Balancing reservoirs, Cedar Cre Project(Tex), Ft. Worth(Tex).

The water supply of Fort Worth, Texas has co from impounded river sources for over fifty yea A long term plan, the Cedar Creek Project, w developed to increase the quantity and treatm of water impounded. The plan involved the Ce Creek Reservoir, 80 miles southeast of Fo Worth; an intake pump station at the reserv 68.2 miles of 72-inch pipeline and associated pu stations, which reach from the reservoir intake a balancing reservoir at the end of the 72-inch s tion of the pipeline; a balancing reservoir wit future capacity of 300 million gallons; and, miles of 84 inch pipeline, connecting the balanc reservoir to the site of Fort Worth's Rolling H Treatment Plant. This $9.5 million plant designed so that total capacity could be dou without adding chemical facilities or increasing number of administrative or laboratory buildi and with the instrumentation for future comp control. The balancing reservoir, located six m from the water treatment station, is situated hilltop so that a gravity line could be run wit energy loss. Because this balancing pond is loc so close to the city, a fail-sage lining was nece ry. The large--620 feet square at the base and feet square at the perimeter--reservoir was with impermeable membrane of nylon-reinfo 'Hypalon' synthetic rubber. The material is forced with a single layer of nylon scrim, o improved strength and dimensional stability, i adversely affected by soil chemicals, microor isms, and is resistant to ozone and uv light. costs of the project was $850,000, with $250,0 this for the liner. es, Irrigation, Control, United Nations, International commissions, Economics.
lentifiers: *Laguna de Bay(Philippines), Lake evation control.

aguna de Bay is one of the largest lakes in utheast Asia and is already in the path of urban pansion of Manila. At present, the lake is ackish and is being studied for transformation to a fresh water supply. Development planning cludes water supply, flood control, fisheries, irgation, and land reclamation. Water quality nagement is a key factor in the lake develop-nt planning. A coordinated effort is being made the Philippine Government and its development n--the Laguna Lake Development Authority--to dertake the necessary research, assisted by a ad array of international bilateral and multibieral agencies. Major findings of studies already mpleted and a description of work underway are esented. The overall program is aimed at the liest possible development of the lake ources. (Bell-Cornell)

OOD PLAIN INFORMATION: LEY CREEK, LINA AND DEWITT TOWNSHIPS, ONONGA COUNTY, NEW YORK.
ny Engineer District, Buffalo, N.Y.
pared for Eastern Oswego Basin-Regional ter Resources Planning Board, June, 1971. 44 8 fig, 5 plates, 5 tab.

criptors: *Floods, *Flood control, *Flood ns, *Legislation, *Water management, Flood-Flood protection, *New York.
ntifiers: *Ley Creek(NY), Syracuse(NY), na Township(NY), Dewitt(NY), Onondaga nty(NY), Intermediate Regional Flood, Stanl Project Flood.

4.4 mile study reach of Ley Creek flows in a terly direction from the junction of its North South branches to its mouth at Onondaga e in Syracuse, New York. Its drainage area of square miles includes 5 major tributaries. ambed gradients are mild and flood plains erally flat. Nearly 3.4 of the flood plain is eloped in commercial and residential properas well as sanitary fill operations. Increasing ulation is encouraging more development. oding can occur any time of the year, but most re floods occur during late winter and early ng when heavy precipitation is augmented by ing snow. Conditions are made worse by en saturated soil. Flood damage prevention sures include enlargement of creek channels, truction of riprapped channel walls, channel ring and acquisition of rights-of-way. No flood regulations exist although New York state several applicable water conservation acts h deter encroachment on the flood plain. A nt flood occurred in 1969 with estimated age of $99,000. An Intermediate Regional d would be more damaging than the 1969 d, cresting at 3.9 feet above stream bank. A dard Project Flood would crest at 8.2 feet e bank level. This report aids in the unanding of local flood problems and provides use guidance. (Salzman-North Carolina)
W75-11785

**FLOOD PLAIN INFORMATION: FLOOD HAZARD REPORT OF 4-7 JULY 1969 FLOOD, HURON RIVER, NORWALK CREEK, OHIO.**
Army Engineer District, Buffalo, N.Y.
May, 1970. 23 p, 28 fig, 12 plates, 3 tab.

Descriptors: *Flood damage, *Flood profiles, *Flood stages, *Floodways, *Historic floods, Flood data, Flood plains, Flood plain utilization, Planning, Reservoirs, Flood proofing, *Ohio.
Identifiers: *Hurnon River(Ohio), *Norwalk Creek(Ohio), Norwalk(Ohio), Flood plain management.

This report details flood conditions and damages of the July 1969 flood on the lower 26 miles of Huron River in northern Ohio and 3.5 miles of a tributary, Norwalk Creek. Although the gaging station on Huron River has been in operation since 1950, data for the peak of the stage-hydrograph for the July 1969 flood was established by indirect survey methods because the gage chart was damaged during the flood. The 1969 flood on Huron River has an estimated discharge of 48,900 cfs and an average recurrence interval of 126 years. The stage at the gage site was 31.1 feet, 7 feet higher than the next highest recorded flood which occurred in January, 1959. Extensive flood damage was estimated at greater than $4 million. Damages from Norwalk Creek through the city of Norwalk were approximately at $1.5 million. During the flood, the collapse of a reservoir wall resulted in closed highways, no domestic water supply and no power supply. The description of the flood and the numerous photographs show that damages will continue to increase if unwise development increases. Flood profiles indicate the amount of fill or elevation of flood proofing required to prevent future damage. The flood plain management program recommends control of future development of the establishment of a floodway. (Diefendorf-North Carolina)
W75-11787

**FLOOD PLAIN INFORMATION: PLUM CREEK, BRUNSWICK HILLS AND MEDINA TOWNSHIPS, MEDINA COUNTY, OHIO.**
Army Engineer District, Buffalo, N.Y.
Prepared for Ohio Department of Natural Resources, Division of Planning, Flood Plain Management Section, June, 1973. 26 p, 25 fig, 7 plates, 3 tab.

Descriptors: *Flood plains, *Flood damage, *Land use, *Planning, Flood plain utilization, Flood data, Flood profiles, Obstruction to flow, Flood stages, *Ohio.
Identifiers: *Plum Creek(Ohio), Medina County(Ohio), Brunswick(Ohio), Brunsick Hills Township(Ohio), Medina Township(Ohio), Sleepy Hollow Lake(Ohio), Lake Brunswick(Ohio), Flood plain management, Intermediate Regional Flood(IRF), Standard Project Flood(SPF).

There is little development within the 5-mile study reach of Plum Creek which flows through Brunswick Hills and Medina Townships in northern Ohio averaging a fall of 21.4 ft/mi over its total 7.1 mile course. Most of the development is in the City of Brunswick or near man-made Sleepy Hollow Lake and Lake Brunswick. There has been little encroachment by man other than highway crossings, but natural obstructions such as dense growth and trees occur along the banks. Local government should establish a floodway to define and maintain the channel. Floods may occur at any time during the year, but are most numerous in late winter and early spring when snowmelt accompanied by moderate precipitation causes flooding. Information pertaining to past floods on Plum Creek is extremely scarce. Since there are no gaging stations within the study area, information from newspaper files and interviews was collected. There was no report of high water marks except in July, 1972 at the sewage treatment plant. The peak discharge of an Intermediate Regional Flood (IRF) within the study reach would range from 1660 to 3000 cfs with channel velocities of 2.2 to 4 ft/sec.; discharge of a Standard Project Flood (SPF) would range from 5630 to 9590 cfs with channel velocities of 3.2 to 4.9 ft/sec. The IRF is recommended by the State of Ohio Department of Natural Resources as the minimum flood level to define the limits of the regulatory flood plain. Brunswick Hills Township trustees are currently working on flood plain regulations. (Diefendorf-North Carolina)
W75-11788

**FLOOD PLAIN INFORMATION: NORTHEAST STREAM GROUP, STOCKTON, CALIFORNIA.**
Army Engineer District, Sacramento, Calif.
Prepared for San Joaquin County; January 1974, 56 p, 11 tab, 23 fig, 37 plates.

Descriptors: *Flood plains, *Flood protection, *Flood damage, *Flood control, Flood forecasting, Flood data, Land use, Planning, Historic floods, Obstuction to flow, Flood plain zoning, Levees, *California.
Identifiers: *Calaveras River(Calif), *Bear Creek(Calif), Stockton(Calif), San Joaquin County(Calif), New Hogan Lake(Calif), Intermediate Regional Flood, Standard Project Flood, Flood plain management.

The Calaveras River and Bear Creek systems flood primarily agricultural land in San Joaquin County northeast of Stockton, California, during winter and spring rainfloods and summer cloudbursts. Protection in the study area is provided by New Hogan Dam on the Calaveras River, which also provides irrigation water. Levees built along the lower reaches of most of the streams also help minimize flood damage. Protection is provided against floods expected to occur at the 50-to-60 year frequency, but larger floods which would exceed channel capacity can be expected to occur. Peak flows estimated for a Standard Project Flood are 1,700 cfs on Calaveras River and 8,000 cfs on Bear Creek, according to calculations derived from the data collected at 8 gaging stations, combined with meteorological data. The greatest flood of record on the Calaveras River occurred in 1911, but far more damage was done in the study area in the floods of 1955 and 1958 because more of the area had been developed by then. In the 1958 flood, about 22,000 acres of the study area were flooded and damage was estimated at $1,400,000. Several levees were breached, and flood waters reached a maximum depth of 3 feet and remained on the land for as long as 3 weeks in the Bear Creek drainage area. The report provides a basis for planning optimum use of flood-prone areas. (Diefendorf-North Carolina)
W75-11789

**FLOOD PLAIN INFORMATION: VENTURA RIVER, VENTURA COUNTY, CALIFORNIA.**
Army Engineer District, Los Angeles, Calif.
Prepared for the County of Ventura, June, 1974. 38 p, 25 fig, 22 plates, 7 tab.

Descriptors: *Floods, *Flood plains, *Flood profile, *Flow, *Obstructions to flow, *Flood damage, River, Flooding, Maximum probable flood, Historic flood, *California.
Identifiers: *Ventura River(Calif), Coyote Creek(Calif), Ventura County(Calif), Ventura(Calif), Intermediate Regional Flood, Standard Project Flood.

Along the Ventura River, major floods have been caused by winter storms of the polar Pacific type which occur November through April and account for 75% of the runoff. Mean seasonal precipitation is 16 inches near the mouth at the Pacific and 40 inches in the mountains at the upper end of the drainage area. Flash floods are typical of the Ventura River Basin; peak flows are attained within a

few hours of rainfall, last for a short time, and subside quickly. High velocities erode and carry large quantities of debris through the canyons and deposit the material on the more developed, gentler slopes of the valley. A levee along the east bank provides major flood protection from floods up to the Standard Project Flood for the City of San Buenaventura. Lake Casitas has a reservoir storage capacity which will substantially reduce peak discharges on Coyote Creek. Ventural County requires new development to be protected against flooding from major streams and its tributaries. Major floods of record occurred in January, 1969, with peak discharge of 58,000 cfs, and February, 1969, with 40,000 cfs peak discharge recorded near Ventura. High velocity flood waters and severe erosion occurred in both floods. Projected floods include the Intermediate Regional Flood (IRF) and the Standard Project Flood (SPF) with peak discharges at Ventura of 78,000 and 89,000 cfs respectively. These floods and resultant erosion would be hazardous to utilities and commercial and residential development in the floodplains in Ventura, Live Oak Acres, Oak View, and neighboring cities. (Park-North Carolina)
W75-11790

**FLOOD PLAIN INFORMATION: CONTRARY CREEK, ST. JOSEPH, MISSOURI.**
Army Engineer District, Kansas City, Mo.
Prepared for the City of St. Joseph, Missouri, October, 1973. 23 p, 11 fig, 15 plates, 3 tab.

Descriptors: *Floods, *Flooding, *Flood plains, *Flood data, *Flood profiles, *Levees, Flood forecasting, Flood discharge, Maximum probable flood, Obstructions to flow, *Missouri.
Identifiers: *Contrary Creek(Mo), St. Joseph(Mo), Intermediate Regional Flood, Standard Project Flood.

Contrary Creek, so called because it flows north contrary to the course of the Missouri River, drains 26 sq/mi adjacent to St. Joseph of which 17.7 sq/mi is above the upper study limit. The flood plain land is used primarily for agricultural production with a few roads and rail lines crossing the Creek. The channel has been widened and straightened and is bounded on both sides by levees. Short duration thunderstorms with high intensity rain, falling mostly in May through September, cause floods of high peaks, high velocities, short duration and relatively small volumes of runoff. Realignment of the lower reach of the Creek causes floodwaters overflowing banks or levees to flow into low lands north or south of the basin. Large floods occured in 1919, 1921, 1942, 1952, 1959, and 1960 but data is unavailable due to lack of stream gages. Expansion of St. Joseph will create pressure for development along Contrary Creek plus the possibility of larger floods. Peak flows for two projected major floods, an Intermediate Regional Flood (IRF) and a Standard Project Flood (SPF), would be 12,000 cubic feet/second (cfs) for an IRF and 21,000 cfs for the SPF and would compare to the estimated 14,600 cfs flow of the 1960 flood. In an IRF some floodwater will overflow the basin and flow north into the low-lying areas of St. Joseph. 'Floodwater overflowing the south levee will be contained between the levee and the road south of the levee. Water overflowing the north levee will remain along the toe of the levee.' Standing water will remain until the stream level falls and the drainage gates are opened. Severe erosion to stream banks and around bridge abutments are expected. The SPF would rise about 3 ft/hr peaking in 13 hours. (Park-North Carolina)
W75-11791

**FLOOD PLAIN INFORMATION: CHITTENANGO CREEK, BRIDGEPORT, ONONDAGA AND MADISON COUNTIES, NEW YORK.**
Army Engineer District, Buffalo, N.Y.
Prepared for Eastern Oswego Basin Regional Water Resources Planning Board, June, 1971. 38 p, 17 fig, 5 tab, 5 plates.

Descriptors: *Floods, *Flooding, *Flood protection, Flood control, Water management, Flood plains, Legislation, *New York, Flood forecasting, Flood plains.
Identifiers: *Chittenango Creek(NY), Bridgeport(NY), Onondaga County(NY), Madison County(NY), Limestone Creek(NY), Butternut Creek(NY), Intermediate Regional Flood, Standard Project Flood.

Chittenango Creek, a part of Oswego River watershed in western New York state, has two main tributaries, Limestone and Butternut Creeks. Draining an area of 288 square miles, the creek's gradient varies from 5 ft/mi to almost 50 ft/mi at its headwaters. Presently, the 7-mile study area near its mouth is used for agricultural or rural purposes, although increasing population of Syracuse area may create pressure for development. Floods occur all times of the year resulting from melting snow with moderate amounts of precipitation in the winter or intense summer precipitation. Natural vegetation as well as two bridges obstruct flood flow. No effective flood plain regulation exists in the area although New York State legislation supports such statutes and attempts to prevent encroachment by mandatory review of any stream disturbance. The greatest known flood occurred in August 1898 although insufficient information exists to determine its exact magnitude. A recent flood in 1960 had a peak discharge of 2,690 cfs. An Intermediate Regional Flood and Standard Project Flood would have peak discharges of 9500 cfs and 35,200 cfs respectively. Designated flood areas will assist local officials in regulating flood plain use. (Salzman-North Carolina)

Wainwright map area lies southeast of Ed-
nton between longitudes 110 degrees and 112
rees west and latitudes 52 degrees and 53
rees north. It covers about 6000 square miles of
tly aspen parkland. Precipitation is about 14
es annually, while potential evapotranspira-
is about 21 inches. Hydrogeological informa-
is abundant for depths less than about 500
. At depths greater than 500 feet, the hydrolog-
nvironment has been inferred from geological
rmation. Geologic units of hydrogeological in-terest include the glacial drift, preglacial sands and gravels, Horseshoe Canyon Formation, Bearpaw Formation, Belly River Formation, and Lea Park Formation. The latter four are Late Cretaceous in age. Groundwater yields are generally between 0 and 25 igpm, with certain areas having much greater yields. Groundwater quality is not exceptionally good; one third to one half of the samples analyzed exceeded provincial standards for total dissolved solids, sulfate, alkalinity, or sodium. Nitrate represents a local pollution problem. In addition to a groundwater availability map, maps are presented showing hydrochemistry of bedrock waters for the depth intervals 0 to 150 feet, 150 to 350 feet, and 350 to 500 feet. Hydrochemistry of drift waters from 0 to 150 feet of depth is also presented. (Visocky-ISWS)

The nonlinear, partial differential equation characterizing the unsteady flow in an unconfined aquifer beneath a circular recharging area was solved numerically using a predictor-corrector method. The results obtained were compared with available linearized solutions. The predictor-corrector method resulted in a tridiagonal set of simultaneous equations which could be solved rapidly by computers. Furthermore, the method was computationally stable. A rectangular artificial groundwater-recharge system was analyzed by use of the alternating-direction implicit scheme with a nonuniform grid spacing. Values of the maximum height of the water table obtained from the numerical scheme were always higher than those calculated from an available linearized solution. A recharge well-unconfined aquifer system was analyzed by coupling the fourth-order Runge-Kutta method with the Lagrange interpolation method. The method was computationally inherently stable for any times. Dimensionless graphical solutions of water table profiles at different times were presented for various conditions. A closed-form solution based on the linearized equation was developed that closely approximates the flow system under consideration. Dimensionless graphical solutions for volume and average rate of recharge were presented for conditions commonly encountered in practice. (Visocky-ISWS)

Identifiers: Partially penetrating wells, Delayed yield, *Aquifer response, Type curves.

An approximate analytical solution describing transient flow toward a partially penetrating well pumped at a constant discharge in a rigid, homogeneous, anisotropic, unconfined aquifer of

infinite radial extension and finite depth, considering flow in the unsaturated zone above the free surface, was presented. The characteristic hydraulic properties of the unsaturated zone, namely the retention and hydraulic conductivity curves, were described by analytical expressions that depended on a parameter which roughly represented the effective thickness of the unsaturated zone. To check the validity of the approximate analytical solution, the problem, free of such approximations, was solved numerically by a finite element scheme for a representative particular case. Comparison between analytical and numerical solutions showed excellent agreement. The influence of the unsaturated zone was found to be negligible for most common cases encountered. In the marginal cases of very shallow rigid aquifers and of soils with particularly large unsaturated effective thickness, the influence of the unsaturated zone upon drawdown was found to be significant only at relatively short times, close to the pumping well and close to the free surface. Identifiers: *Well yield, *Optimum use, Benefit maximization, Operating policy, Economic analysis, Well spacing.

The cost of pumping groundwater is a major factor in water supply; it is necessary to pump a given well at the discharge that maximizes the net benefit of the operation. Previous criteria have ignored the economic aspects of the analysis of this problem. This paper presents a method for determining the optimum operating policy of a well, i.e., at which discharge a well owner receives the most water for his money. A computer code, QOPTIM, is included along with an example of the analysis. The case treated is pumping an existing well at the optimum discharge, where drilling the well is a sunk cost. The real world example shows the importance of considering well losses in any analysis. An appendix lists QOPTIM, which can be easily used by most engineering offices to find the optimal discharge of a given well. The choice of criterion for finding the optimal well discharge is important. Application results of the cost-benefit, optimization method developed herein show power costs for a well to be $2,350/yr greater if the well is pumped at two thirds drawdown rather than at the optimal discharge as found using QOPTIM. al Water Pollution Control Federation, Vol 4, p 858-866, April, 1975. 5 fig, 1 tab, 12 ref.

Descriptors: *Nutrients, *Pollutant identification, *Chemical analysis, Laboratory tests, *Water analysis, Nitrogen, Phosphorus, Analytical techniques.
Identifiers: *Sweden, Intercalibration, Interlaboratory studies.

A program for the intercalibration of methods for chemical analysis of nutrients was conducted in Sweden. Artifical samples with accurately calculated concentrations of known constituents were used for water analysis. Samples were preserved by acidification and distributed in sealed glass ampoules. These samples were then distributed to 76 laboratories where individual methods of analysis were used. Discussion and evaluation of results focused on methods and instrumentation; preservation, stability and pre-treatment of samples; and quality of work in different laboratories. For all parameters studied (such as phosphate phosphorus, total phosphorus, nitrate nitrogen) the Nordic Standard Methods yielded the best results. Most laboratories tested performed the analytical work with acceptable precision. (Prague-FIRL)

**CONTINUOUS DETERMINATION OF TOXICITY OF EFFLUENTS.**
French Patent 13200W/08. Issued January 3, 1975. Derwent French Patents Report, Vol W, No 8, p 9, January, 1975.

Descriptors: *Toxicity, *Sewage, Waste water treatment, Analytical techniques, *Patents, *Microorganisms, Effluents, Liquid wastes, Measurement, Turbidity, *Bioindicators.

The toxicity of liquids in waste water and sewage may be determined by means of microorganisms. A patent was issued whereby these are continuously cultivated in a circulation recipient with a very concentrated nutritive medium and mixed with the dilution liquid. The mixture flows continuously into a small measuring recipient which is sealed against the inflow of air and has a magnetic stirrer, then leaves via an overflow. The oxygen content of the liquid is measured continuously by an oxygen electrode. The liquid to be analyzed is saturated with oxygen in a second recipient where it is simultaneously treated with the nutrient solution. The mixture flows into the recipient then mixes with the mixture from the first chamber; and the two flow out through the overflow. Alteration in the microorganisms due to the toxicity is determined by the measurement of one of the parameters such as turbidity or color changes, which are a function of the vital activities of the organisms. Gig Sanit, 3 p 72-73, 1974.

Descriptors: *Pollutant identification, *Spectrophotometry, Analytical techniques, *Fluorine, *Colorimetry, Chemical analysis, Water analysis.
Identifiers: Alizarin, Zirconium.

A method for spectrophotometric determination of fluorine (F) in surface and sewage waters is described. It is based on Scott's zirconium alizarin colorimetric method and its modification according to Meyer. The zirconium alizarin compound color is weakened by F in acid medium, and also a colorless more stable zirconium and F compound is formed. F content is determined by comparing photocolorimeter or spectrophotometer readings with a series of standard solutions. For 0.1-1.25 mg/l F concentrations, the values of the optical density range from 0.01-0.08. The method allows determination of higher concentrations of F, up to 3.5 mg/l. The error does not exceed 0.9-2.8%.--Copyright 1975, Biological Abstracts, Inc.

**APPARATUS FOR PROVIDING A STATISTICAL COUNT OF PARTICULATE MATERIAL IN A FLUID,**
Protron Associates, Palo Alto, Calif. (assignee).
H. M. Ogle.
United States Patent 3,858,851. Issued January 7, 1975. Official Gazette of the United States Patent Office, Vol 930, No 1, p 326, January, 1975. 1 fig.

Descriptors: *Patents, *Samples, *Suspended solids, Analytical techniques, Liquids, Statistical analysis, *Pollutant identification.
Identifiers: Particulate material, Light beams.

A method of measuring particulate material in a sample volume of particulate material suspended in a liquid was patented. The liquid is contained within a sealed transparent container. A liquid inspection apparatus consists of means for: generating a well-defined beam of light; directing the well-defined light beam through the container; and, scanning the light beam over at least one path located entirely within a confined area transverse to the direction of the light beam. This sequentially illuminates particulate material in the portion of liquid from which bursts of light are scattered. Additionally, means for detecting the scattered bursts of light produce a sequence of electrical signals. Means responsive to the electrical signals occurring within a selected interval of time provide a measure of the particulate material within the sample volume. (Prague-FIRL)

Descriptors: *Natural watercourses, *Analytical techniques, *Spectrophotometry, Chemicals, *Pollutant identification, Copper, Water pollution, Water analysis.
Identifiers: *Picramine-epsilon, *Sugars.

The proposed method of determining microquantities of sugars in natural waters is based on the selective and highly sensitive reaction of Cu using the reagent picramine-epsilon. Determination of sugars is possible without preliminary separation of the bulk of the concomittant components. The method is sensitive to 0.1 micro-g/sample. The method can be used for direct determination of sugars in waters with markedly different composi-

tions of inorganic and organic components and degrees of pollution.--Copyright 1975, Biological Abstracts, Inc.

**RADIOACTIVE - TRACER DISPLACEMENT METHOD FOR THE DETERMINATION OF SMALL QUANTITIES OF NICKEL,**
Savannah State Coll., Ga. Dept. of Chemistry.
R. A. German, D. L. Hamilton, and M. P. Menon.
Analytical Chemistry, Vol 47, No 4, p 658-661, April, 1975. 2 fig, 4 tab, 12 ref.

Descriptors: *Nickel, *Heavy metals, *Pollutant identification, *Analytic techniques, Radioactivity, Neutron activation analysis.
Identifiers: *Interference studies, *Transition metals.

The displacement reaction between nickel and zinc ethylene-diaminetetraacetate labeled with Zn65 can be used to determine traces of nickel as low as 0.05 ppm in interference - free samples. This method is based on the extraction of radioactive zinc displaced by nickel from the zinc chelate which is labeled with 245-d Zn65 into a dithizone-carbon tetrachloride solution and the subsequent measurement of the activity of an aliquot of the extract. The transition metals do interfere with the analysis, but the interferences of many may be removed by suitable masking reagents. For the analysis of samples containing significant concentration of transition metals, nickel has to be separated by the dimethyl glyoxime method prior to the addition of the radioreactent. This method is more sensitive than most of the spectrophotometric methods as well as the neutron activation technique. (Delfiner-Vanderbilt)

od is outlined for the determination of lead he range 5-2,000 ng per ml, after dissolution tical samples, by co-precipitation with cal- xalate and ignition at 850-900C to CaO:Pb or, and measurement of its solid state lu- ence at 530 nm. In this manner, trace quan- f lead were directly determined in leaves, ry and wet ashing, and in synthetic blood. er-Vanderbilt) 1541

**LOSS OF TRACE ELEMENTS FROM NATURAL WATER DURING STORAGE. I. BEHAVIOR OF 203 HG AND 65 ZN ADDED TO POND WATER,**
Tokyo Univ. (Japan). Dept. of Agricultural Chemistry.
Y. Dokiya, S. Yamazaki, and K. Fuwa.
Environmental Letters, Vol 7, No 1, p 67-81, 1974. 7 fig, 3 tab, 8 ref.

Descriptors: Adsorption, *Spectroscopy, *Heavy metals, *Trace elements, *Standing waters, *Chemical properties, Stability, Ponds, *Pollutant identification.
Identifiers: *Atomic absorption spectroscopy, *203 Hg, *65 Zn, Biological Activity, Preservatives.

Dilute solutions (1 ppb-1 ppm) of inorganic mercury and zinc were prepared using distilled water and pond water, labelled with 203 Hg and 65 Zn. The rapid loss of 203 Hg at the level of ppb from distilled water is caused by adsorption to the surface of containers and vaporization to the atmosphere. In pond water some biological activity additionally participates in the loss. In 65 Zn solution, the biological activity alone is the main cause of loss from the solution. Some preservatives are examined. Among the preservatives examined, one millimole-cysteine seems to be the most satisfactory. The acids, long assumed as the most common preservatives, do not work against the vaporization of Hg. For the natural water, addition of 0.1 Normal HCl together with one millimole cysteine appears to be the best to preserve the ionic mercury as the microbes' growth is prevented at lower pH. The direct determination of mercury in natural water at the level of ppb was made by flameless atomic spectroscopy. (Litoff-Vanderbilt)

**LEAD AND ARSENIC LEVELS OF DAIRY CATTLE IN PROXIMITY TO A COPPER SMELTER,**
Washington Univ., Seattle. Dept. of Environmental Health.
R. M. Orheim, L. Lippman, C. J. Johnson, and H. H. Bovee.
Environmental Letters, Vol 7, No 3, p 229-236, 1974. 2 fig, 5 tab, 4 ref.

Descriptors: *Heavy metals, *Lead, *Spectrophotometry, *Arsenic compounds, Analytic techniques, *Cattle, *Copper, Milk, Soil analysis, Water pollution, *Pollutant identification, Air pollution, Washington.
Identifiers: *Atomic absorption spectrophotometry, Smelter, Refinery, *Puget sound(Wash), Blood, Hair, Dairy cattle, Delves cup modification.

Blood and milk from two groups of dairy cows were analyzed for lead and arsenic by atomic absorption spectrophotometry; hair samples from the same cows were analyzed for arsenic only. Those cows within 15 miles of the copper smelter showed a twenty fold increase of arsenic in hair over those more than 35 miles removed. The investigation took place on the eastern shoreline of the southern part of Puget Sound where a copper smelter and refinery are located. The ore that is refined contains large amounts of lead and arsenic. There are two inhabited islands two miles north of the smelter. The results indicated no health problems from drinking water or from dairy products, at least during the summer months. The soil and hair samples did show a build-up or storage of lead and arsenic in the fallout area. (Delfiner-Vanderbilt)

**SUBMICROGRAM PER GRAM CONCENTRATIONS OF MERCURY IN ORCHARD LEAVES DETERMINED BY ISOTOPE DILUTION AND SPARK-SOURCE MASS SPECTROMETRY,**
National Bureau of Standards, Washington, D.C. Inst. for Materials Research.
R. Alvarez.
Analytica Chimica Acta, Vol 73, No 1, p 33-38, 1974, 1 fig, 2 tab, 11 ref.

Descriptors: *Heavy metals, *Mercury, *Analytical techniques, *Leaves, *Isotope studies, *Mass spectrometry, Electrolysis, *Pollutant identification.
Identifiers: Orchard leaves, Isotope dilution, Spark source mass spectrometry, Sub-microgram concentrations, Wet ashing, Microphotometers.

A method was developed for determining submicrogram per gram concentrations of mercury in orchard leaves by use of a stable isotope dilution procedure in conjunction with the spark source mass spectrograph. A 5 gram sample was spiked with a solution of mercury, isotopically enriched in 201 Hg and 198 Hg. The 198 Hg served as a carrier. After wet-ashing the sample with nitric and perchloric acids under reflux and distilling most of the acid, the isotopically equilibrated mercury was electrodeposited onto high-purity gold wires for sparking in the mass spectrograph. The concentration was calculated from the altered isotope ratio, 201 Hg/202 Hg, and other data. The results were compared with those obtained by atomic absorption spectrometry and neutron activation, leading to a certified value of 0.155 plus or minus 0.015 microgram per gram for the mercury content of orchard leaves, SRM 1571 of the National Bureau of Standards. **THE ESTIMATION OF THE AMOUNT OF EMPIRE MIX CRUDE OIL IN MULLET, SHRIMP, AND OYSTERS BY LIQUID CHROMATOGRAPHY,**
Mississippi State Univ., Mississippi State. Dept. of Chemistry.
D. H. Miles, M. J. Coign, and L. R. Brown.
In: 1975 Conference on Prevention and Control of Oil Pollution Proceedings; American Petroleum Institute, EPA and U.S. Coast Guard, March 1975, p 149-154, 5 fig, 2 tab, 26 ref.

Descriptors: *Chromatography, Gas chromatography, *Oil pollution, Methodology, *Analytical techniques, *Bioassay, *Mullets, *Shrimp, *Oysters, Aquatic life, Animal physiology, *Pollutant identification.
Identifiers: Liquid chromatography, Empire mix crude oil, Tissue analysis, Bioaccumulation, Comparative techniques.

A method for rapidly estimating the amount of oil taken up by small (0.1g) samples of specific tissues from mullet, shrimp and oysters which were exposed to empire mix crude oil under controlled laboratory conditions was presented. The results obtained by utilizing the liquid chromatographic (LC) method described were compared to results obtained using conventional gas chromatographic (GC) techniques. Either method was valid for large samples of tissues. Data from routine bioassay experiments showed that 50% of the samples of shrimp tissue, 23% of the mullet tissue samples, and 49% of the oyster tissue showed the presence of oil only by the LC method. The LC method also afforded a greater amount of replications and conduction of multiple analyses on a given tissue. (Katz)

**HYDROCARBONS ASSOCIATED WITH SUSPENDED PARTICULATE MATTER IN SAN FRANCISCO BAY WATERS,**
Naval Biomedical Research Lab., Oakland, Calif.
L. H. DiSalvo, and H. E. Guard.
In: 1975 Conference on Prevention and Control of Oil Pollution Proceedings; American Petroleum Institute, EPA and U.S. Coast Guard, March 1975, p 169-173. 2 fig, 5 tab, 19 ref.

Descriptors: *Mussels, *Oil pollution, *Suspended solids, *Suspended load, *Sampling, *Organic compounds, *Water sampling, *Methodology, Chromatography, Sediments, Water pollution sources, Summer, *California.
Identifiers: *Bay mussels, *Mytilus edulis, Double settling tube, Biosamples, *San Francisco Bay(Calif), Thin-layer chromatography, Biological agents.

Suspended sediments were obtained at seven stations in San Francisco Bay during the summer of 1974 using a double settling tube. Bay mussels Mytilus edulis were used as biological agents for the active entrapment and deposition of suspended particulates occurring in the water. Total alkane and aromatic hydrocarbons were determined in the recovered sediments. Calculations suggested that 13.5 or more tons of presumably pollutant hydrocarbons were present in association with suspended particulate matter in the bay system at any given time during the sampling period. (Katz)

P. M. O'Donnell.
Available from the National Technical Information Service, Springfield, Va 22161 as NASA-TND-7931, $3.25 in paper copy, $2.25 in microfiche. NASA TN D-7931, March 1975. 13 p, 8 fig, 1 tab, 12 ref.

Descriptors: *Zinc, *Fluorine, *Halogens, *Kinetics, *Thermodynamics, Inorganic compounds, Temperature, Physical properties, Pressure, Analysis, Fluorides, Halides, Fluoridation, Salts, Properties, Thermal properties, Metals, Rates, Microscopy, X-ray analysis, Chemical reactions.
Identifiers: *Fluorination reactions, *Zinc fluoride, Fluorination apparatus, Rate constants, Parabolic rate constant, Zinc vaporization, Vaporization reactions, Pressure sensitive, Temperature sensitive.

The reaction between zinc metal and fluorine gas was studied over the temperature range of 100 to 400 degrees C and at pressures from 6 to 83 kilonewtons per square meter. At all temperatures and pressures the rate followed a parabolic equation. The parabolic rate constant was markedly pressure dependent. Above 300 degrees C, simple kinetics were complicated by zinc vaporization. At low temperatures an activation energy of 11.7 kilojoules per mole was calculated; however, a break was observed in the Arrhenius plot at about 300 degrees C. There was a clear change in the nature of the temperature dependence due to a change in mechanism between the low temperature region and the high temperature region. (Henley-ISWS)

**THE CONTINUOUS MONITORING OF WATER QUALITY,**
Clyde River Purification Board, Glasgow (Scotland).
G. A. Best.
The Public Health Engineer, No 15, p 73-84, May 1975. 9 fig, 6 tab, 11 ref.

Descriptors: *Water quality, *Monitoring, *Warning systems, *Water supply, Bodies of water, Dissolved oxygen, Suspended solids, Phenols, Oil, Metals, Pesticides, Installation costs, Biodegradation, Decomposing organic matter, Potable water.
Identifiers: Clyde River(Gt. Brit), Biodegradable organic matter, Cyanide.

The Clyde River Purification Board recently installed two continuous water quality monitors to assess changes and to provide warning when water supply is unsuitable for potable use. The two stations were built at Glasgow Green on the lowest reach of the River Clyde and at Orbiston Park, just upstream of a proposed lake. Installation costs were high, and the stations require regular maintenance by a technician with some knowledge of electronics. Three additional stations have not been built because the Board feels that the available monitoring equipment is not reliable enough. Accurate long-term measurements can be made of dissolved oxygen, suspended solids, pH, conductivity, and temperature. However, better sensors are needed for measuring biodegradable organic matter, phenols, oil, cyanide, metals, and pesticides. Such monitoring stations are useful when they are connected directly to the headquarters' laboratory, so that immediate warnings may be given in cases of water quality deterioration. (Kramer-FIRL)

Descriptors: *Industrial wastes, *Japan, *Water pollution sources, Industrial water, Waste water, *Water quality standards, *Analysis, Coliforms, Bacteria, Chemical oxygen demand, Suspended solids, Alkalinity, Phenols, *Industrial plants, Food processing industry, Chemical wastes, Urban drainage, Nitrogen, Cement goods factories, Metal products plants.

Factories (28) were classified into 3 categories: factories of hard ware (metal goods), of food goods, of cement goods and others. To determine whether industrial waste water fulfilled the water quality standards of Tsuchiura city (Japan), analytical experiments were carried out from April 1972-April 1973 for: pH, chemical oxygen demand (COD), suspended solids (SS), phenol, alkalinity, NH4+-N, NO+2-N, Cl-, CN-, Cu2+, Pb2+, Fe3+, Mn2+, Cd2+, Cr6+, ions, total Cr and number of coliform bacteria. Excessive CN-, Zn2+, Cr6+, OH- ions and SS were often in the drainage from some metal product plants. Excess number of coliform bacteria, COD and SS were in the industrial waste water from food product plants. Cr6+ ion was detected in samples from cement goods factories. River pollution was caused mainly by industrial waste waters from metal product plants and food product plants, and urban sewage drainage.--Copyright 1975, Biological Abstracts, Inc.

Pollution of the Coastal water of the Black Sea with polynuclear aromatic hydrocarbons (PAH) was studied using the fine-structure liminescent spectroscopy method based on Shpolsky's effect at the temperature of liquid nitrogen (77K) with previous chromatographic fractionation. Fluorescent and phosphoresent methods were developed for quantitative determination of PAH in sea water, bottom sediments and animal (fish) tissue with photoelectric and photographic recording of the spectrum for the straight-chain paraffins (acenapthene: 321 nm and 478.4 nm; phenanthrene: 345.7 nm and 463 nm; 3,4-benzpyrene: 403 nm; fluoranthene: 407.8 nm). Measures are proposed for preventing pollution of the sea with hydrocarbons.--Copyright 1975, Biological Abstracts, Inc.

METHODS OF DETECTING THE FLUORINE ION IN AIR AND WATER, (IN RUSSIAN),
G. S. Salyamon, and M. V. Popelkovskaya.
Gig Sanit, Vol 38, No 4, p 65-67, 1973.

Descriptors: *Chemical analysis, *Air pollution, Water, *Fluorine, Fluorides, *Analytical techniques, *Pollutant identification, Cesium.
Identifiers: Alizarin, Cyanine, Eriochrome, Sulfonic-acid, Sulfophenylazo-1, Zirconium, Chelating agents.

To select the most sensitive and specific methods for analyzing HF and fluorides in air and water, 16 methods recommended for this purpose and 9 for determination of the F ion in other media (solutions, biomaterials, etc.) were tested. From these 25 methods, 3 were selected: using Zr-ECC (Zr-eriochromcyanine), Zr-SPADNS (Zr complex of 4-sulfophenylazol1,18-dihydroxynaphthalene-31,61-disulfonic acid), and Ce-alizarin chelating agent. The first 2 methods have advantages with respect to the range of determination and simplicity of reagent preparation. All 3 indicators react selectively with F- in the presence of 10 to the 2nd power-10 to the 4th power microgram of many substances. Zr-SPADNS should be used primarily for analyzing HF and fluorides in the atmosphere and air of work zones, bodies of water and waste waters, without the separation of F- from admixtures in many cases. The other 2 methods, Ce-alizarin chelating agent and Zr-ECC, are recommended for analyzing air and bodies of water but not waste waters.--Copyright 1975, Biological Abstracts, Inc.

THE BEHAVIOUR OF METAL TETRAMETHYLENEDITHIOCARBAMATES IN THE GRAPHITE-TUBE FURNACE FOR ATOMIC ABSORPTION SPECTROMETRY,
Ljubljana Univ. (Yugoslavia). Inst. of Chemistry.
S. Gomiscek, Z. Lengar, J. Cernetic, and V. Hudnik.
Analytics Chimica Acta, Vol 73, No 1, p 97-106, November, 1974, 7 fig, 3 tab, 12 ref.

Descriptors: *Heavy metals, *Chelation, *Spectrophotometry, *Chemical analysis, Cadmium, Cobalt, Copper, Iron, Nickel, Lead, Vanadium, Argon, Oxygen, *Pollutant identification, Separation techniques.
Identifiers: *Atomic absorption spectroscopy, Graphite tube furnace, *Metal chelates, *Metal carbamates, Organic reagents, Atomization, Oxidative decomposition, Metal tetramethylenedithio carbamates.

Some phenomena occurring during the atomization of metal tetramethylenedithiocarbamates (MeTMDTC) in the graphite tube furnace were observed. Explanations based on studies of the behavior of MeTMDTC in argon and oxygen at higher temperatures and on the results of x-ray diffraction, differential thermal and thermogravimetric studies were proposed. The metals used were Cd, Co, Cu, Fe, Ni, Pb, and V. Curves show the dependence of the absorption peaks on the destruction temperature. These curves are characterized by tendencies toward decreased absorption signals for temperatures of 60C and 100C and by the relative constancy of the signals for destruction for temperatures from 200C to 1100C. Cadmium and lead TMDTC deviate from this behavior. (Delfiner-Vanderbilt)
W75-11797

THE DETERMINATION OF CADMIUM IN SEA WATER BY RADIOACTIVATION,
Naval Undersea Center, San Diego, Calif.
H. V. Weiss, K. Chew, M. Guthman, and A. Host.
Analytica Chimica Acta, Vol 73, No 1, p 173-176, November, 1974, 1 fig, 1 tab, 2 ref.

Descriptors: *Cadmium, *Cadmium radioisotopes, *Heavy metals, *Neutron activation analysis, *Crystallization, Assay, Separation techniques, Analytical techniques, Neutron absorption, Mercury, *Pollutant identification.
Identifiers: Beta-ray activity, Indium, Oxine, 8-hydroxyquinoline.

A method is described of isolating cadmium from sea water by co-crystallization with 8-hydroxyquinoline (oxine). The technique involved neutron activation analysis. Beta-ray activity measurements were made of 115 Cd-115In. Results of the assay of cadium in two different volumes of stock sea water are as follows. Eight analyses of 0.5 liter samples and five of 1 liter samples averaged 0.737 plus or minus 0.041 and 1.451 plus or minus 0.044 micrograms, respectively. The overall standard deviation is 4.7%. The determination of mercury in sea water is inherently compatible with the analytical scheme described. (Delfiner-Vanderbilt)

## 5B. Sources Of Pollution

SANITARY AND BACTERIOLOGICAL EVALUATION OF THE RAW MATERIAL, AIR AND WASTEWATERS OF SOME BAST FIBER PLANTS IN THE UZBEK SSR, (IN RUSSIAN),
Uzbekskii Nauchno-Issledovatelskii Institut Sanitarii, Gigieny i Profzabolevanii, Tashkent (USSR).
M. S. Artykov, and N. P. Masharipov.
Gig Sanit, 4 p 101-102, 1974.

Descriptors: *Fibers(Plant), Industrial wastes, Waste water, Pollutants, *Water pollution sources, *Microorganisms, Bacteria, Aerobic bacteria, *Streptococchus, USSR, Public health, *Air pollution.
Identifiers: *Ambari, *Bast, Hibiscus-cannabinus, Kenaf, Occupational disease, Staphylococcus, Uzbek-SSR.

The Uzbek SSR ranks 1st in the USSR in the cultivation and production of ambari (kenaf, Hibiscus cannabinus). The bacterial contamination of industrial wastewaters, raw materials, air of shops, and washings from the upper air passages of workers at 2 bast fiber plants in the Tashkent region producing ambari was studied. The air at 1 plant contained 40 pathogenic strains of Staphylococcus and Streptococcus and at the other plant, 58 strains in 1 m to the third power; in the raw material, 43 and 15 strains were isolated, respectively. Bacterial contamination of the upper air passages by pathogenic microflora was higher at 1 plant than the other.--Copyright 1975, Biological Abstracts, Inc.

SANITARY AND HYGIENIC EVALUATION OF SEEPAGE WATERS OF STRUCTURES PROTECTING RESERVOIRS (IN RUSSIAN),
Gorkovskii Meditsinskii Institut (USSR).
T. S. Yurasova.
Gig Sanit. 4. p 96-97, 1974.

Descriptors: *Potable water, *Reservoirs, *Drainage systems, *Seepage, Analysis, *Water pollution sources, Filtration, Filters, Soil filters, Screens, Structures, Hydraulic structures, Barriers, Reservoir leakage, Reservoir construction, Bacteria, Sanitary engineering, Public health.

The drainage systems of a number of hydro developments discharge a considerable amount of seepage waters into reservoirs which supply the drinking water of cities. A sanitary and hygienic evaluation of seepage waters at the Gorki reservoir (USSR) showed that seepage waters can be used for drinking. However, the chemical composition and bacterial indices of seepage waters depend not only on the composition and quality of the groundwaters, filtering soils and filters of protective structures, but also on the sanitary state of the territory surrounding them. Low quality seepage waters were observed in cases of polluted surrounding territory.--Copyright 1975, Biological Abstracts, Inc.

Identifiers: *Japan(Obihiro City).

In Aug., 1969, in 1 area in Obihiro City, the well water of 5 farm houses (No. 1, 2, 3, 4 and 5) was polluted, and the polluting source was suspected to be the public refuse disposal area which was 550 m from the nearest house. To determine any connection, 2 driven pump wells were prepared at distances of approximately 10 m (No. 6) and 500 m (No 7) in the intermediate zone. As a control, 2 normal wells nearby (No. 8 and 9) and 3 surface water river samples (No. 10, 11 and 12) were tested. These 12 water samples were collected and tested, covering about 24 items. The main causes of the unsuitableness for drinking were combinations of high coliform count, high content of iron, and concurrent detection of nitrogen of ammonia and nitrite. The degree of pollution of the examined wells was in order: No. 7, No. 4, and No. 1, corresponding to their distance from the refuse disposal area to the downstream. In each of the examined items of pollution, high values were noted at the 500 m point (No. 7) than at the 10 m point (No. 6) in both of the experimentally driven pump wells. The pollution spread along the underground water vein as bed water.--Copyright 1975, Biological Abstracts, Inc.

**PHYSICOCHEMICAL PROPERTIES OF DREDGE SPOIL,**
Canada Centre for Inland Waters, Burlington (Ontario).
A. Mudroch, and A. J. Zeman.
Journal of the Waterways, Harbors and Coastal Engineering Division, Proceedings of American Society of Civil Engineers, Vol 101, No WW2, Proceedings Paper 11317, p 201-216, May 1975. 10 fig, 7 tab, 22 ref, 2 append.

Descriptors: *Cation exchange, *Dredging, *Harbors, *X-ray diffraction, *Physicochemical properties, *Great Lakes, *Lake Erie, *Lake Ontario, Plasticity, Spoil banks, Sediment load, Infrared radiation, Electron microscopy, Mineralogy, Sediments, Retention.
Identifiers: Citrates, Dredges, Mineral content, Infrared absorption, Postglacial sediments, Clycol.

Physicochemical changes resulting from the subaerial exposure of dredge spoil during land disposal were investigated using 5 fine-grain bottom sediment samples from the lower Great Lakes. Air-drying of unoxidized postglacial sediments increased cation exchange capacity and decreased plasticity. Air-drying of a Pleistocene oxidized sediment did not affect these parameters appreciably. The difference was attributed to an irreversible collapse of weathered swelling minerals and the oxidation of ferrous and manganous ions in postglacial sediments. Mineralogical composition and changes caused by citrate-dithionite extraction were examined by X-ray diffraction, infrared absorption, electron-optical, and surface area measurements. (Roberts-ISWS)

Technical Report No 74-7, February 1974. 45 fig, 11 tab, 8 ref, 6 append.

Descriptors: *Water quality, *Data collecti *Columbia River, *Washington, Water pollut Water pollution sources, Pollutants, Colifo Water temperature, Dissolved oxygen, Munic wastes, Pulp wastes, Discharge(Water), Samp Water analysis, Water quality standards.
Identifiers: *Longview.

The Washington State Department of Ecology lected water quality data from the Columbia R at a point 12 miles below Longview, Washin (at Port Westward, Oregon) from December to November 1972. The data were collected continuously operating automatic water qu data acquisition system. The Columbia Riv this point is designated by Washington State W Quality Standards as Class A waters. The rive ceeded maximum allowable coliform stan during most of the year. During the low period in late summer and early fall, the sporadically did not meet water quality stan for temperature and dissolved oxygen. Columbia River was also monitored for diss oxygen and temperature by the National M Fisheries Service near Prescott, Oregon, ab miles upstream from Longview. No app water quality violations were observed duri year at this location. It was concluded that t dustrial and municipal discharges in the Long Kelso area significantly contribute to the ap water quality violations recorded at Port ward. These conclusions support the resul tained by the U.S. Environmental Prot Agency in 1970 and 1971 on water quality tions in the lower Columbia River. (Rob ISWS)

**ELENIUM IN WATERS IN AND ADJACENT O THE KENDRICK PROJECT, NATRONA OUNTY, WYOMING,**
eological Survey, Reston, Va.
A. Crist.
ailable from Supt of Documents, GPO, ashington, DC 20402 $2.85. Water-Supply Paper 23, 1974. 39 p, 3 fig, 3 plate, 3 tab, 17 ref.

scriptors: *Water pollution sources, *Path of llutants, *Groundwater, *Surface waters, Vyoming, Inorganic compounds, Hydrogeology, ater chemistry, Geochemistry, Rocks, Chemical operties, Water wells, Sampling, Chemical anal-s, Geologic time.
ntifiers: *Selenium, *Natrona County(Wyo).

enium in concentrations exceeding the max-im limit, 0.01 milligrams per liter or 10 micro-ms per liter, recommended by the U.S. Public alth Service in 'Drinking-Water Standards, 2,' is present in waters in areas near Casper, o. Some streams containing selenium flow into North Platte River upstream from several mu-ipalities that obtain water from the river and the ivium along the river. The area of investigation ludes about 725 square miles in Natrona County central Wyoming. Geologic formations in the a contain selenium that may have been derived m deposits of seleniferous material or from vol-ic emanations brought down by rain. The enium concentration in 82 samples of taceous rocks ranged from less than 10 to 4,200 rograms per kilogram. Of four samples of Ter-y rocks analyzed, three contained no selenium one had a selenium concentration of 40 micro-ms/kg. The selenium concentration in 93 sam-s of Quaternary rocks ranged from less than 10 20 micrograms/kg. The selenium concentration he groundwater in these areas have not reached ate of equilibrium in the aquifer. Irrigation un-btedly has accelerated movement of selenium in and from irrigated areas. W. Wood, and R. L. Bassett.
er Resources Research, Vol 11, No 4, p 553-August 1975. 6 fig, 3 tab, 15 ref.

criptors: *Artificial recharge, *Water spread-*Chemical reactions, *Anaerobic bacteria, xas, Groundwater recharge, *Water quality, tration rates, Gravitational water, Soil proper-Sulfates, Bicarbonates, Hydrogen ion con-ration, Geology, Data collections, Chemical ysis, *Water reuse.
tifiers: *Lubbock(Tex).

ficial recharge basins or spreading sites com-ly exhibit reductions in infiltration rates after onged periods of submergence. This loss in in-ation rate has often been shown to be as-ated with a large population of anaerobic or ltative anaerobic bacteria in the material un-ying the basin floor. An artificial recharge ex-ment in a spreading basin at Lubbock, Texas, wed a significant change in the chemical quali-f recharged water that was associated with the wth of anaerobic bacteria. Sulfate-reducing eria reduced the sulfate concentration of the arge water at this location by 80 mg/liter. The rbonate concentration was increased by more 150 mg/liter, and the pH decreased 1 unit dur-he same time period. The change in chemical ity occurred suddenly and corresponded to a natic decrease in the infiltration rate in the basin. These observations on the chemical changes in recharged water make it possible to differentiate between anaerobic bacteria and other causes of reduced hydraulic conductivity in this recharge basin. The anaerobic conditions appear to start at depth and work toward the surface, thereby suggesting a process that involves adsorption of organic material and consumption of dissolved oxygen with depth. **KINETICS OF LEAD RETENTION AND DISTRIBUTION IN SUCKLING AND ADULT RATS,**
Yugoslav Academy of Sciences and Arts, Zagreb. Inst. for Medical Research and Occupational Health.
B. Momcilovic, and K. Kostial.
Environmental Research, Vol 8, No 2, p 214-220, October 1974. 1 fig, 3 tab, 18 ref.

Descriptors: *Kinetics, *Lead, *Heavy metals, *Metabolism, Animal physiology, Gamma Ray, Radioactivity, Rodents, *Path of pollutants, *Absorption.
Identifiers: Suckling rats, Adult rats, Intraperitoneal injection, Scintillation counter, Brain, Blood, Kidneys, Liver, Teeth.

The kinetics of lead distribution was studied in suckling and adult rats eight days after a single intraperitoneal injection of 203 Pb. Marked differences were observed in the kinetics of lead retention and distribution in suckling as compared to adult rats. Most striking was the eightfold concentration of lead in the brain of sucklings as compared to adults. The rate of 203 Pb disappearance was lower in the whole body, blood and kidneys, but higher in the liver, while the deposition processes predominated in the brain, femur and teeth of sucklings as compared to adult animals. The activity of 203 Pb was determined in a scintillation counter. (Delfiner-Vanderbilt)

**DETERMINATION OF THE APPARENT COMPLEXING CAPACITY OF LAKE WATERS,**
Canada Centre for Inland Waters, Burlington (Ontario).
Y. K. Chau, R. Gachter, and K. Lum-Shue-Chan.
Journal of the Fisheries Research Board of Canada, Vol 31, No 9, p 1515-1519, September 1974. 3 fig, 1 tab, 18 ref.

Descriptors: *Heavy metals, *Trace elements, *Water chemistry, *Lakes, Pollutants, *Copper, Canada, Lake Erie, Lake Ontario.
Identifiers: *Stripping voltammetry(Anodic), *Lignands, Hamilton Harbor(Ont.).

A sensitive and accurate method is described for the measurement of the apparent complexing capacity of lake waters. It is based on the measurement of labile copper by differential pulse anodic stripping voltammetry after a number of ionic copper spikes have been allowed to equilibrate with the complexing materials in a water sample. Coefficients of variation for the determination of EDTA at a level of 0.50 micro mole per liter in Hamilton Harbor water were 6 and 8%. Analysis of 7 replicates of a Hamilton Harbor water sample gave an apparent complexing capacity of 0.52 micro mole per liter Cu equivalent with a relative standard deviation of 7.7%. Analyses of a number of samples from Lake Erie and from lakes near Sudbury, Ontario gave a range from nondectable to 0.70 micro mole per liter Cu equivalent of complexing capacity. J. W. Bulkley, and A. P. Mathews.
Technical Report No 42, Septemb4r 1974. MICHU-SG-75-200. Grant No 04-4-158-23.

Descriptors: Water quality, *Water conservation, *Water quality control, *Water management(Applied), Water pollution, *Water utilization, Shores, *Shore protection, *Great Lakes, *Lakes, Governments, Water districts, Water resources development, Surveys, Sewage treatment, Land use, Industrial effluents, Population density.
Identifiers: Shore quality, Shoreline quality, Great Lakes shoreline, Shoreline maintenance, Shoreline management, Environmental surveys.

A questionnaire survey conducted among 650 govermental units in the Great Lakes area has identified the levels of water quality in the respective areas, the perceived factors contributing to the destruction of water resources and possible solutions to the problem of deteriorating water quality. One-way frequency distributions obtained, based on the 300 responses to the questionnaires, indicate that the water quality is medium or lower in 92% of the cases, while it is low or very low in 35% of the cases. Inadequate municipal sewage treatment and inadequate industrial effluent treatment were identified to be the most common factors causing the destruction of water resources. Analysis of two-variable relationships have been made with a view to link the chain of causal factors influencing water in the Great Lakes. Water quality is found to vary with the type of land use and population density, decreasing with increasing degree of industrialization and decreasing with increasing population density. (NOAA)

D. L. Lindell, and R. C. Sonsen.
Soil Science Society of America Proceedings, Vol 38, No 2, p 368-372, March-April, 1974. 3 fig, 2 tab, 10 ref.

Descriptors: Fertilization, *Fertilizers, Sulfates, *Sulfur, Hydrogen, Soil properties, Soils, *Manganese, *Nebraska, *Soil treatment, Bentonite.
Identifiers: *Sulfur-bentonite.

Seven Nebraska soils were used to compare prilled sulfur and sulfur-bentonite formulation in regard to the amount of sulfate-sulfur, manganese and hydrogen released to a leaching solution after successive incubations. Also the effects of sulfur fertilizer granule concentrations in the soil were studied. Generally, the amount of sulfate-sulfur and manganese and the pH values in leachates from the columns containing sulfur-bentonite were not different from those from columns containing prilled sulfur. Differences among soils could not be explained on the basis of measured soil properties. The relationships between the amounts of sulfate-sulfur or manganese released and percentage sulfur or sulfur-bentonite in the soil were generally quadratic with the maximum release occurring in the range 30 to 60% sulfur. The greatest amount of sulfur released per gram sulfur added occurred at the lowest sulfur to soil ratio studied. (Skogerboe-Colorado State)

Natural Environmental Research Council, Anglesey (Wales). Unit of Marine Invertebrate Biology.
G. Walker, P. S. Rainbow, P. Foster, and D. J. Crisp.
Marine Biology, Vol 30, No 1, p 57-65, 1975. 2 fig, 3 tab, 26 ref.

Descriptors: *Bioindicators, *Heavy metals, *Zinc, Aquatic animals, *Animal physiology, Water pollution sources, Path of pollutants.
Identifiers: Balanus balanoides, Elminius modestus, Lepas anatifera, *Barnacles, Gut tissues, Tissue analysis, Bioaccumulation.

Barnacles (Balanus balanoides, Eliminius modestus, Lepas anatifera) from several different sites accumulate the heavy metal zinc. The majority of the zinc was deposited in the tissues associated with the gut, and the level of zinc in soft body tissue generally reflected well the level of zinc in the immediate sea-water environment. The zinc accumulated in the gut tissues was in the form of discrete granules, mainly within the parenchyma cells which surround the gut. These granules probably exist as an isoluble zinc salt. A comparison of the zinc level in barnacles with those recorded for some other marine organisms indicated the possible usefulness of barnacles as indicators of zinc pollution. (Katz)

Agricultural Research Service, Morris, Minn North Central Soil Conservation Research Center
R. E. Burwell, D. R. Timmons, and R. F. Holt
Soil Science Society of America Proceedings, Vo 39, No 3, p 523-528, May-June 1975. 5 tab, 14 ref.

Descriptors: *Nutrients, *Runoff, *Sediments Nitrogen, Phosphorus, Potassium, Snowmelt Precipitation(Atmospheric), Erosion, Agriculture Chemistry of precipitation, Seasonal, Fertilizers Surface runoff, Crops, On-site investigations *Minnesota.
Identifiers: *Nutrient transport, Nutrient losses Soil cover.

Nitrogen (N), phosphorus (P), and potassium (K losses in surface runoff water and sediment wer determined for five soil cover conditions on Barnes loam soil in west-central Minnesota. Th five soil cover conditions studied were: (1) co tinuous clean-cultivated fallow, (2) continuou corn, (3) corn in rotation, (4) oats in rotation, an (5) hay in rotation. Losses of water, sediment, an nutrients were determined for three season periods: (1) critical runoff period caused by me ing snow and ice, (2) critical erosion period fro corn planting to 2 months later, and (3) noncritic runoff-erosion period exclusive of periods 1 and Much of the annual sediment and nutrient loss occurred during the critical erosion period. Sno melt runoff accounted for much of the annu water and soluble nutrient losses. Average annu quantities of NH4-N and NO3-N contributed precipitation exceeded the annual losses in surfa runoff, but ortho-P losses in surface runoff we greater than the amount contributed by precipi tion. **A TOPOGRAPHIC-HYDROGEOLOGIC MOD FOR SOLID WASTE LANDFILL SITING,**
Iowa State Univ., Ames. Dept. of Earth Science L. V. A. Sendlein, and R. C. Palmquist.
Ground Water, Vol 13, No 3, p 260-268, May-J 1975. 10 fig, 18 ref.

Descriptors: *Landfills, *Water pollut *Hydrogeology, *Solid wastes, *Waste dispo Geomorphology, Topography, Land classifi tion, Water quality, Groundwater, Surface wat Permeability, Groundwater movement, races(Geologic), Ravines, Valleys, Flood pla Water table, *Model studies.
Identifiers: *Contamination enclaves, Upland Crest.

Geomorphic and hydrogeologic studies shown that the material, topographic, gro water, and surface-water characteristics of a ticular landscape position are all related. Bec of this, an analysis of the topography should a the prediction of the material, groundwater, surface-water characteristics of a disposal within the local area. Topographic consider of potential solid waste disposal sites thus vides insight about the physical characteristi the site and shape of the resulting contamin enclave. Possible topographic positions disposal sites are floodplain, valley terrace, v side, upland crest, upland ravine, upland v and upland flat interfluve. Upland sites are ch terized by the outward flow of both ground and surface water, whereas valley sites are ch terized by the through flow of both ground surface water. Upland sites are consi preferable over valley sites because of the g

likelihood of the refuse remaining dry. An analysis of groundwater flow patterns indicates that the greatest potential for extensive groundwater contamination exists for upland sites, which are in groundwater recharge areas. The least potential for extensive contamination exists for properly placed valley sites, which are in groundwater discharge areas. (Visocky-ISWS)

**SOLID PARTICLE SETTLEMENT IN OPEN-CHANNEL FLOW,**
Colorado State Univ., Fort Collins. Dept. of Civil Engineering.
R-M. Li, and H. W. Shen.
Journal of the Hydraulics Division, Proceedings of American Society of Civil Engineers, Vol 101, No HY7, Paper 11460, p 917-931, July 1975. 7 fig, 1 tab, 13 ref, 2 append. NSF ENG 74-03037.

Descriptors: *Computer models, *Sedimentation rates, *Settling velocity, *Stochastic processes, Turbulent flow, Hydraulics, Water pollution, Open channel flow.
Identifiers: *Random walk model, *Eulerian length scale.

A random walk was formulated to describe the settlement of solid particles in open-channel flows. Both uniform and mixed-size sediment particles were tested. Results from simulations indicated that the probability density function of the settling length can be a lognormal distribution. The mean settling length can be estimated by the ratio of the unit-width discharge to the fall velocity of particles. The coefficient of variation was determined to be a power function of the ratio between flow shear velocity and fall velocity of solid particles. The simulation results were generally in agreement with measured data. The procedure for the design of settling basins was presented. (Lardner-ISWS)

Descriptors: Irrigation, *Irrigation water, Crop production, Vegetables, Soils, Water reuse, Path of pollutants, Soil treatment, Viruses, Waste water(Pollution), *Waste water treatment.
Identifiers: Coxsackievirus, *Enteroviruses, Coronaviruses, *USSR(Uzbekistan).

The degree of enterovirus contamination of soil and vegetables grown under the hot climatic conditions of Uzbekistan (USSR) on fields irrigated with a mixture of household and industrial waste waters that underwent biological treatment was investigated. The irrigation waste water, soil and ash water from vegetables grown on the fields were studied. Virological investigations showed contamination by enteroviruses of all objects studied. Titration of the isolated cytopathic agents showed that the objects were contaminated by Coxsackie B virus. Waste water should not be used for crop irrigation.--Copyright 1975, Biological Abstracts, Inc.

Instituto Espanol de Oceanografia, Madrid (Spain).
Antonio Fernandez Del Riego.
Bol Inst Esp Oceanogr, 172 p 1-38, 1973. Illus.

Descriptors: Pulp and paper industry, *Water pollution sources, *Pulp wastes, Europe, Effluents, Industrial wastes, Waste water disposal, *Water purification, Treatment, *Water pollution treatment, Waste treatment, Flocculation, Filteration, Separation techniques, Carbonation, Sea water, Lignins, Mullets.
Identifiers: Cardium-edule, Ligninsulfonic, Lyes, Mytilus-edulis, Platichthys-flesus, *Spain, Lourizan inlet.

Pollution caused by the dumping of Kraft pulp lyes near the Playa de Placeres (Spain) make bathing impossible, produce a strong pungent odor and cause fish to avoid the large abiotic zone in this area. Conditions could be improved by recovering cellulose fibers in suspension and implementing improved biochemical purification in reservoirs. Lime treatment would change the color of effluents from their present dark brown to a clear yellow. Large scale dilution of these treated effluents in sea water and consequent flocculation of organic material would greatly decrease the biological oxygen demand of the water. Alkalinity caused by the lime would be eliminated through carbonation by a previous aeration and by the enormous diluting capacity of the sea water. Marine organisms observed in the polluted areas included eels, oysters, Cardium (=Cerastoderma) edulis, Mytilus edulis, Platichthys flesus and mullet.--Copyright 1975, Biological Abstracts, Inc.

**A STEADY-STATE MODEL OF ISOTOPIC FRACTIONATION ACCOMPANYING NITROGEN TRANSFORMATIONS IN SOIL,**
Washington Univ., St. Louis, Mo. Center for the Biology of Natural Systems.
G. Shearer, J. Duffy, D. H. Kohl, and B. Commoner.
Soil Science Society of America Proceedings, Vol 38, No 2, p 315-322, March-April, 1974. 3 fig, 17 ref.

Descriptors: *Mathematical studies, Nitrification, Ammonification, *Nitrogen, *Model studies, Soils, *Isotope fractionation, *Path of pollutants.

A steady-state mathematical model of isotopic fractionation accompanying certain nitrogen transformations in soil is developed. The model takes into account ammonification, nitrification, and immobilization; and predicts that the 15N/14N ratios of nitrate and ammonium ion depend in part upon the ratio of the rates of immobilization to nitrification under field conditions is unlikely to be the same as under the conditions of laboratory incubation experiments. Therefore, this prediction provides a possible explanation for differences observed between the 15N/14N ratio of nitrate extracted from soil cores and that of nitrate released during laboratory incubation of the same soils. The model described is ammenable to experimental test. If verified, an expanded version of the model may be a useful aid in the study of nitrogen transformations in the field. **FISH TOXICANTS IN KRAFT EFFLUENTS,**
British Columbia Univ., Vancourver. Dept. of Zoology.
I. H. Rogers, J. C. Davis, G. M. Kruzynski, H. W. Manhood, and J. A. Servizi.
Tappi, Vol 58, No 7, p 136-140, July, 1975. 6 fig, 18 ref, 1 tab.

Descriptors: *Pulp wastes, *Toxins, *Fish, Biological treatment, *Toxicity, Biochemical oxygen demand, Lethal limit, Freshwater, Saline water, Salmon, Bioassay, Aeration, Water pollution sources, Industrial wastes, Wastes, Waste water treatment, Effluents, Water pollution treatment, Water pollution control, Sockeye salmon, Chum salmon, Water quality standards, Water pollution effects, Pine trees, Softwood.
Identifiers: Resin acids, Lodgepole pine, Wood extractives, Dehydroabietic acid, Abietic acid, Kraft mills.

Biologically treated effluent from a bleached kraft mill was studied in a bench-model aeration system to determine whether additional biological treatment would consistently detoxify combined effluents. Comparison of 29, 58, and 99-hour treatment periods indicated that toxicity, BOD, and resin acids were most consistently reduced during the lengest treatment time and met current Canadian guidelines for kraft mill effluent. The neutral components of the effluent, derived mainly from the unsaponifiable fraction of lodgepole pine wood extractives, frequently caused fish mortalities, and were shown to be related to wood furnish. L.D.(50) values of 0.67 mg/liter (o.554-0.670, 95% confidence limits) in freshwater and 0.19 mg/liter (o.156-0.234, 95% confidence limits) in saltwater were determined in tests with the pinewood extract against chum salmon fry. Flowthrough freshwater bioassays with dehydroabietic acid against yearling sockeye salmon yielded an estimated 96-hour L.D.(50) of 0.5 mg/liter. In another test, yearling sockeye salmon exposed to a 1.5 mg/liter dehydroabietic acid concentration suffered 50% mortality in 94.5 hours in saltwater. The same fish stock, exposed to an equal resin acid concentration in freshwater, experienced 50% mortality in 14.7 hours. Thus, toxicity of the resin acid was greater in freshwater than in saltwater, which is the reverse of results obtained with the neutral fractions. (Sykes-IPC)

Identifiers: *Human infections(Intestinal), Pathogens, Prophylaxis.

Water samples (266) obtained in a study of microbial contamination of a body of water used as a domestic and industrial water supply source and as an effluent receiving body were analyzed. Pathogenic bacteria of the intestinal group were found in 16.7% of the samples. No correlation was found between indirect sanitary-bacteriological indices of water quality and direct isolation of pathogens. Consequently, both determination of the indirect indices and direct methods of isolating pathogens should be used when evaluating the epidemiological role of water in the occurrence of intestinal infections.--Copyright 1975, Biological Abstracts, Inc.

**NATURAL AND ACCELERATED PHOSPHATE MOBILITY, (IN DUTCH),**
H. L. Golterman.
Geol Mijnbouw, Vol 53, No 4, p 205-206, 1974.

Descriptors: Lakes, *Phosphates, *Water pollution sources, Sewage, Detergents, Chemical wastes, *Domestic wastes, *Cyanophyta, Europe, Water pollution effects, *Eutrophication.
Identifiers: *Netherlands.

High phosphate levels in Dutch lakes resulted from the incursion of phosphates into sewage at a faster rate than it could be removed by natural processes. Excessive phosphate in the lakes caused the outgrowth of toxic blue-green algae which may eventually make the drinking water unsafe. The replacement of phosphate detergents by NTA (nitrilotriacetic acid) and the artifical removal of phosphates from sewerage are advocated.--Copyright 1975, Biological Abstracts, Inc.

**INFLUENCE OF LEAD ON CALCIUM AND STRONTIUM TRANSFER THROUGH THE DUODENAL WALL IN RATS,**
Yugoslav Academy of Sciences and Arts, Zagreb. Inst. for Medical Research and Occupational Health.
N. Gruden, M. Stantic, and M. Buben.
Environmental Research, Vol 8, No 2, p 203-206, October, 1974, 2 tab, 7 ref.

Descriptors: *Lead, *Heavy metals, *Animal physiology, *Calcium, Diets, Mammals, Rodents, *Strontium
Identifiers: Rats, Duodenal wall, Everted gut sac method, Lead acetate, Oral doses, Gastric intubation

Five-week-old female albino rats were given daily doses for 1 or 2 weeks of lead as acetate ranging from 2 micrograms to 40 milligrams by gastric intubation and sacrificed on the 8th or 15th day of the experiment. Calcium-45 and 85Sr were used as markers to assess the calcium and strontium transfer through the duodenal wall by the everted gut sac method of Wilson and Wiseman (1954). Doses of lead acetate greater than 20 micrograms per day decreased the transfer of both calcium and strontium across the duodenal wall and these transfers decreased further with increased doses of lead, an effect which was independent of whether the rats were killed on the 8th or 15th day of the experiment. Doses of lead acetate greater than 200 micrograms per day, however, did not produce a further decrease in these transfers. The retention of both calcium and strontium in the intestinal wall was unaffected by the lead treatment. (Delfiner-Vanderbilt)

**EMBRYOPATHIC EFFECTS OF DIFFERENT ROUTES OF ADMINISTRATION OF MERCURIC ACETATE IN THE HAMSTER,**
Darmouth Medical School, Hanover, N.H. Dept. of Anatomy.
T. F. Gale.
Environmental Research, Vol 8, No 2, p 207-213, October, 1974, 1 tab, 29 ref.

Descriptors: *Mercury, Animal physiology, *Environmental effects, *Heavy metals, Transfer, Biological membranes, Mammals, Rodents.
Identifiers: *Mercury acetate, Hamster, *Embryopathic effects, Embrotoxicity, Intraperitoneal, Intravenous, Oral, Subcutaneous.

A comparison was made between 4 modes of administration of mercuric acetate into the pregnant golden hamster on Day 8 of gestation, i.e., intrapertoneal (ip), intravenous (iv), oral (0) and subcutaneous (sc) in respect to induced embryonic damage. The embryos were recovered either 4 or 6 days later and the number of resorption sites and abnormal embryos were recorded. The major manifestations of embryoic damage included an increased resorption rate, and small retarded edematous embryos. Several miscellaneous congenital malformations were also detected. In general, these embryopathic effects as well as indicators of maternal toxidity were dose dependent for each mode of administration. Primarily on the basis of equivalent resorption rates the following sequence of decreasing efficacy in producing harmful effects was demonstrated; ip greater than iv greater than sc greater than 0. The results are discussed within the general context of the known deleterious effects of mercury on biological systems and the controversy regarding the transmission in inorganic mercury from the pregnant animal to the developing embryo. (Delfiner-Vanderbilt)

**BILIARY EXCRETION OF PHENYL AND METHYL MERCURY CHLORIDES AND THEIR ENTEROHEPATIC CIRCULATION IN RATS,**
Institut Hygieny a Epidemiologie, Prague (Czechoslovakia).
M. Cikrt, and M. Tichy.
Environmental Research, Vol 8, No 1, p 71-81, August, 1974, 2 fig, 4 tab, 20 ref.

Descriptors: *Mercury, Animal physiology, *Kinetics, *Toxocity, Radioactivity techniques, Fungicides, *Pollutant identification, Rodents.
Identifiers: *Biliary excretion, *Phenyl mercury chloride, *Methyl mercury chloride, *Enterohepatic circulation in rats, Inorganic mercury scintillation counter.

The kinetics of biliary excretion of mercury applied as phenyl mercury (203) chloride (PMC) or methylmercury (203) chloride (MMC) were studied in rats during the first 24 hours after intravenous administration. The content of total mercury in the bile, plasma, liver, kidneys, gastrointestinal tract, urine, and feces was determined. The enterohepatic circulation of mercury after administration of PMC in rats was compared with that after administration of MMC or inorganic mercury. The differences found in both the kinetics and the distribution of PMC, MMC, and inorganic mercury in rats were discussed. (Delfiner-Vanderbilt)

**EFFECTS OF METHYLMERCURY CHLORIDE ON RANA PIPIENS TADPOLES,**
Wisconsin Univ., Madison. Dept. of Pathology.
I. W. Chang, K. R. Reuhl, and A. W. Dudley, Jr.
Environmental Research, Vol 8, No 1, p 82-91, August, 1974, 4 fig, 1 tab, 53 ref.

Descriptors: *Mercury, *Aquatic environment, *Frogs, *Immature growth stage, *Water pollution effects, Animal physiology, Pathology.
Identifiers: *Methylmercuric chloride, *Tadpoles, Histochemical techniques, Light microscopic examination.

Rana pipiens tadpoles were allowed to be raised in water containing various concentrations of methylmercuric chloride or were injected with 0.025 ml of 0.1% aqueous solutions of methylmercuric chloride (0.025 mg Hg), every other day for ten days. All the tadpoles which were raised in water containing more than 0.05 ppm mercury died within 48 hours. The distention of body cavities and eventual death of these tadpoles was believed to be the result of a disturbance of the osmotic regulatory system by the mercury. Total arrest of further development and differentiation was observed in tadpoles which were raised in water containing 0.001-0.01 ppm mercury. Extensive deposition of blood pigment (hemosiderosis) was observed in the livers of the mercury-injected tadpoles, which was though to be predisposed by the hemolysis of the red blood cells by mercury followed by severe peripheral edema and hemopoietic reactions in the kidneys of these tadpoles. (Delfiner-Vanderbilt)

**UPTAKE, DISTRIBUTION AND FATE OF 20 HG-ETHYLMERCURIC CHLORIDE IN THE GUPPY AND THE COONTAIL,**
Oregon State Univ., Corvallis. Dept. of Agricultural Chemistry.
S. C. Fang.
Environmental Research, Vol 8, No 1, p 112-11
August, 1974. 3 fig, 3 tab, 6 ref.

Descriptors: *Heavy metals, *Mercury, *Fis
Environmental effects, *Water pollution effect
*Radioactivity, Physiology, Spectrophotometr
Gas chromatography, Pollutant identificatio
Path of pollutants, Absorption.
Identifiers: *Mercury-ethylmercuric chlorid
*Guppy, *Coontail, Gammascintillation, Inorgan
mercury, Organic mercury, Electron capture d
tector.

The guppy (Lebistes resticulatus) and coont
(Ceratophyllum demersum) were exposed to wa
containing 203 Hg-labeled ethylmercuric chlori
(EMC). The EMC uptake was related to the ti
of exposure and the concentration of EM
Highest concentration of 203 Hg was found in
internal organs of the guppy and the body has
least concentration. The biological half-life of
Hg from EMC was approximately between 20
23 days. Both organisms are capable of convert
the absorbed EMC to inorganic mercury with
coontail having a slightly higher rate (34%) of c
version as compared to the average of 29% for
guppy during a seven-day period. Both organs
accumulated slightly more methylmercu
chloride (MMC) than EMC from a solution c
taining the same concentration of EMC or M
There was little conversion of MMC to inorga

mercury by the guppy, indicating the stability of MMC in this organism. The absorbed MMC molecule was also more stable than the EMC in the coontail. (Delfiner-Vanderbilt)

**ULTRASTRUCTURAL EFFECTS OF ACUTE TETRAETHYLLEAD POISONING ON NERVE CELLS OF THE RABBIT BRAIN,**
Cincinnati Univ., Ohio. Dept. of Environmental Health.
W. J. Niklowitz.
Environmental Research, Vol 8, No 1, p 17-36, Aug, 1974, 8 fig, 65 ref.

Descriptors: *Poisons, *Heavy metals, *Lead, Cytological studies, Laboratory animal, Small animals(Mammals), Animal physiology.
Identifiers: *Tetraethyllead poisoning, Rabbit brain, *Nerve cells, Cytopathogenesis.

The ultrastructural effects on nerve cell components of selected brain areas (frontal cortex, cerebellum, hippocampus) were studied after exposure of rabbits to tetraethyllead (TEL). A single dose of 100 mg/kg of TEL leads, after a latency period of 12 to 18 hours, to neurological disorders such as convulsions, and produces significant lesions of components of pyramidal cells and astroglial cells. These develop before the onset of major neurological signs of toxic manifestation. In general two types of degenerative cell changes were identified: cellular pyknosis and cellular hydrops, each specific to certain cell layers of selected brain areas. The subcellular manifestation of nerve cells undergoing hydropic degeneration exhibit a distinct pattern. The following sequence of appearance of structural alterations was determined: (1) folding of the nuclear membrane, (2) swelling and severe lesions of mitochondria, (3) hypertrophy of Golgi complexes and (4) patchy chromatolysis of the ergastoplasm. Progressive hypertrophy of Golgi saccules and vacuolization of the ergastoplasm areas lead to a vaculor hydropic degeneration of affected nerve cells. The cytopathogenesis is discussed in regard to recent findings concerning the subcellular mechanism of tetraethyllead intoxication. (Delfiner-Vanderbilt)

**PHYTOPLANKTON IN LAKE MASCARDI (RIO NEGRO, ARGENTINA), (IN SPANISH),**
Instituto National de Limnologie, Santo Tome (Argentina).
Maria O. Garcia De Emiliani, and Marta Schiaffino.
Bol Sci Argent Bot, Vol 15, No 4, p 411-426, 1974, illus.

Descriptors: *Chlorophyll, Lakes, Phytoplankton, Sampling, Stratification, Temperature, Seasonal, Thermal stratification, Water pollution effects.
Identifiers: Ankistrodesmus-gracilis, Argentina(Lake Mascardi), Melosira-pseudogranulata, Rhizosolenia-eriensis, Rhodomonas-minuta, Rio-negro, Transparency, Manso River, Algal growth.

A study of the phytoplankton in Mascardi Lake, carried out from March 1970-April 1971, was done on the basis of periodical samplings in 3 stations at various depths. Qualitative and quantitative changes in the composition of the phytoplankton population and some considerations to the chlorophyll a content and relations to different physical and chemical parameters were studied. Mascardi is a monomictic lake with temperature always above 4C during the circulation period (July-Sept.) and thermal stratification with a thermocline of variable depth localization (between 5-35 m deep). The thermal behavior of the lake and the water transparency reveal the influence of Manso River (the main tributary) exert especially in the west branch of the lake. The vernal circulation provides favorable conditions for algal growth due to the increase of nutrient concentration together with relatively benign temperatures. Cell number begins to increase at that period, reaching maximum concentrations in Sept. and diminishing progressively during summer and autumn. The most frequent species found were: Ankistrodesmus gracilis, Rhodomonas minuta, Rhizosolenia eriensis and Melosira pseudogranulata.--Copyright 1975, Biological Abstracts, Inc.

**EFFECTS OF FISH-PONDS NEAR JAKUBOVO ON THE ORNITHOCENOSE THERE, (IN CZECH),**
Komenskeho Universita, Bratislava (Czechoslovakia). Katedra Syst. Ekol. Zool.
L. Kocian.
Biologia (Bratisl), Vol 28, No 8, p 671-678, 1973.

Descriptors: *Fish ponds, *Vegetation, Water pollution effects.
Identifiers: *Czechoslovakia(Jakubovo), *Ornithocenosis.

In 1968-1969 an ornithocenological study was carried out on some fish-ponds in Zahorie (Czechoslovakia). The building of new fish-ponds has had an effect on the ornithocenose, and it is compared with the ornithocenose of an earlier stage--wet meadows. In the 1st stage the dominant birds live among the water plants; in the 2nd stage, birds living on the water surface predominate. The number of birds living among water plants remains the same in the 2nd stage; birds living on the water surface showed some changes. In the 2nd stage there was an increase in the number of species living on the edges and banks of ponds. Birds belonging to the steppe group make use of the ponds and their vegetation as trophic or hiding areas. Comparing fish-ponds with large water expanses, the elements are relatively similar. In both cases the ecological group of birds living on the water surface predominates.--Copyright 1975, Biological Abstracts, Inc.

**A FOOD WEB MODEL FOR LAKE MICHIGAN PART 2-MODEL FORMULATION AND PRELIMINARY VERIFICATION,**
Michigan Univ., Ann Arbor. Dept. of Civil Engineering.
R. P. Canale, L. M. DePalma, and A. H. Vogel.
Technical Report No 43. March 1975 150 p, 78 fig, 8 tab, 79 ref. MICHU-SG-75-201. Grant No 04-5-158-16.

Descriptors: *Food chains, *Food webs, *Ecosystems, *Limnology, *Lake Michigan, Nutrients, Balance of nature, Fish food organisms, Biology, Eutrophication, Life cycles, Zooplankton, Plankton, Phytoplankton, Fish, Ecological distribution.
Identifiers: Food models, Food web model, Alewife concentrations.

Previous plankton models for the Great Lakes have considered the interactions among dissolved nutrients, chlorophyll a, and total zooplankton. These models have been developed primarily for the purpose of predicting the gross effects of nutrient input control and urban growth on the phytoplankton standing crop. However, more complex ecological problems, such as the effect of eutrophication on the forage fish and the effect of foreign marine fish species on the plankton composition, require complex food web models. The purpose of this report is to justify, develop, and verify a preliminary lower food web model for Lake Michigan. The report details the underlying hypothesis, mathematical formulation, and preliminary verification of a lower trophic-level model. It is expected that the model will provide guidance on the requirements of additional scientific research on food web transfer mechanisms and on the requirements of a comprehensive field monitoring program. **MERCURY CYCLING IN A SMALL HAWAIIAN ESTUARY,**
Geological Survey, Honolulu, Hawaii. Water Resources Div.
S. N. Luoma.
Tech. Memo. Report No. 42, Sea Grant College Working Paper No. 5, December 1974. 42 p. (NSG) 14-31-0001-3811 and 4011; 04-3-158-29 (NOAA).

Descriptors: *Mercury, Biochemistry, *Heavy metals, Metals, Water pollution, Public health, Toxicity, Model studies, Mathematical studies, Estuaries, *Estuarine environment, Oceanography, Ecosystems, *Hawaii.
Identifiers: *Inorganic mercury cycling, Heavy metal contamination, Mercury analyses, Mercury poisoning, Nereis succinea, Palaemon debilis, Mercury content, Ala Wai Canal(HI).

Uptake from food and water and loss of 203 $HgCl_2$ were studied in two detritus feeders the polychaete Nereis succinea and the shrimp Palaemon debilis. During 1973 to 1974, total mercury analyses were also conducted on sediment and biota samples collected. Detritus feeders concentrated dissolved 203 Hg from 160 to 310 times over the concentration is sea water. Little 203 Hg was accumulated from labelled estuarine sediment; the steady state concentration of 203 Hg in the animals was 0.0025 to 0.015 times the concentration in the sediment the animals ingested. Net excretion of 203 Hg was slow relative to accumulation in both species. The total mercury content of shrimp and worms collected from the estuary showed a temporal pattern of variation. Samples of shrimp collected at five day intervals were used, with a mathematical description of the accumulation and loss of metal by the shrimp to simulate biotic mercury dynamics in the estuary. The simulation showed that mercury levels in shrimp in the Ala Wai Canal were never at steady state over the 1973-74 sampling period, and indicated the most important source of biologically available mercury in the estuary was some inorganic, solute form of the metal. **INFLUENCE OF SOME BIOCIDES EMPLOYED IN THE WOOD-PROCESSING INDUSTRY ON GROWTH OF GREEN ALGAE,**
Jyvaskyla Univ. (Finland). Dept. of Biology.
V. Eloranta.
Aqua Fennica, p 21-32, 1974. 6 fig, 2 tab, 24 ref.

Descriptors: *Chlorophyta, *Pesticides, *Organic pesticides, *Chlorophyll, *Toxicity, Lethal limits, Primary productivity, Water pollution sources, Pulp and paper industry.

Identifiers: *Ankistrodesmus falcatus, Chlorophyll-a, *Biocides, *Slimicides, Bioaccumulation, NasPCP, Panacide, Fennosan, F-50, S-45, Grace 849, Fennosan B-100.

The effects of six organic biocides on green algae, Ankistrodesmus falcatus were studied. Chlorophyll-a content was used as a measure of growth. Na-PCP, commonly used in pulp and paper industries, was the most toxic of the slimicides. The LC-50 was 1.0 mg/l Na-PCP for green algae. Panacide, also a cyclic hydrocarbon and containing chlorine, was next toxic. Fennosan F-50, S-45, and Grace 849 were less toxic. Fennosan B-100 was least toxic. (Katz)

**PHYTOPLANKTON DIVERSITY AND CHLOROPHYLL-A IN A POLLUTED ESTUARY,**
Montclair State Coll., Upper Montclair, N.J. Dept. of Biology.
J. M. McCormick, and P. T. Quinn.
Marine Pollution Bulletin, Vol 6, No 7, p 105-106, July 1975. 2 fig, 1 tab, 6 ref.

Descriptors: *Phytoplankton, *Chlorophyll, *Estuaries, *Nannoplankton, *Seasons, Photosynthesis, Water pollution sources, Speciation, Biomass, Temperature, Salinity, Dissolved oxygen, Laboratory studies, Bioindicators, *New Jersey.
Identifiers: *Chlorophyll-a, Newark Bay(NJ).

The quantity of phytoplankton in Newark Bay, New Jersey as indicated by chlorophyll-a content of the water, was low in winter and early spring, and fluctuated greatly during spring and summer. Chlorophyll-a concentrations were less than 20 micro g/l until April. Between April and August, three phytoplankton blooms were indicated by concentrations up to 81.4 micro g/l. Net phytoplankton diversity values indicated generally eutrophic conditions; however, there was no significant correlation between diversity and chlorophyll-a concentrations. A role of nannoplankton in blooms was indicated. Temperature, salinity and dissolved oxygen variations were also measured. (Katz)

**HIGH COPPER CONCENTRATIONS IN SQUID LIVERS IN ASSOCIATION WITH ELEVATED LEVELS OF SILVER, CADMIUM AND ZINC,**
Moss Landing Marine Labs., Calif.
J. H. Martin, and A. R. Flegal.
Marine Biology, Vol 30, No 1, p 51-55, 1975. 1 fig, 4 tab, 17 ref.

Descriptors: *Aquatic animals, *Animal physiology, *Metals, *Molluscs, Silver, Cadmium, Zinc, Copper, Iron, Path of pollutants, Bioassay, Laboratory tests, Metabolism, Pollutant identification.
Identifiers: *Squids, Loligo opalescens, Ommastrephes bartrami, Symplectoteuthis oualaniensis, Livers, Tissue analysis, Bioaccumulation, Sublethal concentrations.

Livers from 43 Loligo opalescens, 14 Ommastrephes bartrami, and 7 Symplectoteuthis oualaniensis were analyzed for their silver, cadmium, copper, zinc and iron contents. Copper concentrations of up to 15,000 micro g/g dry weight were found in L. opalescens in conjunction with significant correlations between this element and Ag, Cd, and Zn. The latter elements are known to affect Cu metabolism in terrestrial organisms; however, whether the correlations occurring in marine organisms represent casual, or cause and effect, relationships is as yet unknown. (Katz)

**SYNERGISTIC EFFECTS OF SALINITY, TEMPERATURE AND HEAVY METALS ON MORTALITY AND OSMOREGULATION IN MARINE AND ESTUARINE ISOPODS (CRUSTACEA),**
Liverpool Univ., Port Erin (England). Dept. of Marine Biology.
M. B. Jones.
Marine Biology, Vol 30, No 1, p 13-20, 1975. 5 fig, 6 tab, 28 ref.

Descriptors: *Heavy metals, *Isopods, *Crustaceans, *Temperature, *Salinity, Mortality, Toxicity, Bioassay, Laboratory tests, Cadmium, Zinc, Lead, Mercury, Water pollution effects.
Identifiers: *Osmoregulation, *Synergistic effects, *LT-50, Idotea baltica, Idotea neglecta, Idotea emarginata, Eurydice pulchra, Jaera albifrons, Jaera nordmanni, Bioaccumulation.

Marine species (Idotea baltica, I. neglecta, I. emarginata, and Eurydice pulchra) and estuarine species (Jaera albifrons and J. nordmanni) of isopods demonstrated low mortalities in 100% SW with 10 and 20 ppm of Cd, Zn, and Pb, but a decrease in salinity caused an increase in the toxicities of these metals and reduced the LT-50 values. Mortalities at 10 degrees C were generally higher than those recorded at 5 degrees C. Effects of heavy metals upon the osmoregulatory ability of the isopods were indicated. (Katz)

**DECOMPOSITION OF UREA ASSOCIATED WITH PHOTOSYNTHESIS OF PHYTOPLANKTON IN COASTAL WATERS,**
Nagoya Univ. (Japan). Water Research Lab.
O. Mitamura, and Y. Saijo.
Marine Biology, Vol 30, No 1, p 67-72, 1975. 3 fig, 2 tab, 22 ref.

Descriptors: *Ureas, *Nitrogen compounds, *Photosynthesis, Light, *Phytoplankton, Aquatic life, Nitrites, Ammonia, Nitrates, Nitrogen cycle, Tracers, Decomposing, Organic matter, Coasts, Carbon dioxide.
Identifiers: *Light intensities, Decomposition, C-14, Bioaccumulation.

The urea concentation in seawater in Mikawa Bay, Japan ranged from 1.3 to 5.9 microgram-at.N/l and comprised 12-40% of the dissolved organic nitrogen. Using 14C labelled urea, the rate of CO2 liberation from urea and the incorporation rate of urea carbon into the particulate organic matter were determined. Incubation experiments with exposure to different light intensities revealed that the rate of CO2 liberation from urea and the incorporation of urea carbon into particulate organic matter change with light intensity, showing a pattern similar to that of photosynthesis. Descriptors: *Sludge, *Land use, *Environmental effects, *Soil properties, Phosphorus, Nitrogen, Cadmium, Crops, Fertilizers, Algae, Lakes, Eutrophication, Water quality, Water table, Toxicity, Water pollution effects, Path of pollutants.
Identifiers: Zinc-cadmium ratio.

The environmental impact of land disposal of wastes is discussed. For sludge disposal to agricultural lands, soil properties should be evaluated. Soils with a high water table are not suitable for waste disposal. Studies are being done on concentrations and movement of nitrogenous compounds in the soil, the distribution of phosphorus, and the assessment of cadmium in crops and soil. Nitrogen in sludge applied to agricultural land is useful as fertilizer and can increase crop yield. Phosphorus can also be useful for agriculture. Both of these elements are suspect in lake eutrophication growth of algae, and poor water quality. Cadmium in certain quantities is toxic to man and animals the absorption of cadmium by plants may relate to the zinc-cadmium ratio of the soil. (See also W75-11715) (Dean-FIRL)

Identifiers: *Cancer irroratus, *Tissue analy *Bioaccumulation, Intermoult cycle, Muse Hemolymph, Sublethal concentrations.

Variations of copper and zinc content w analyzed during the intermoult cycle for Cance rroratus in the following organs and tissues:

oskeleton, hepatopancreas, hypoderm, gills, iemolymph and muscles. The hemolymph showed he largest copper concentration while the muscles presented the largest zinc content. Except for the nuscles, all organs and tissues showed significant $P < 0.01$) variations of zinc during the intermoult ycle. Variations of copper content were statistically different ($P < 0.01$) in any tissue. A significant increase ($P < 0.01$) of the copper and zinc ontent took place in the hemolymph during the C4 stage. A correlation-regression analysis etween copper, zinc and water content was carried out for each tissue and organ. A positive correlation ($P < 0.01$) between both metals occurred or the hemolymph, the gills and the hepatopancreas. Hypotheses were proposed to explain such orrelations. (Katz)

Descriptors: Effluents, *Halogens, *Bromine, Water quality, *Chlorine, *Chemical wastes, Surveys, *Rhodophyta, *Crustaceans, *Algae, *Amphipoda, Saline water, *Hydrogen ion concentration, Growth rates, Water pollution sources, Environmental effects, Silts, Toxicity, Plant physiology, Animal physiology.
Identifiers: Echinoderms, Polyzoa, Laminaria hyperborea.

Investigations of the fauna and flora of a rocky coast were carried out in the vicinity of an acidified, halogenated effluent discharge. Many species, both littoral and sublittoral, were excluded from the area of the outfall while a few were present in increased numbers. Echinoderms, Polyzoa and Amphipod Crustacea together with the red algae appear to be particularly sensitive to the reduction in water quality. An analysis of the fauna associated with Laminaria hyperborea suggested the presence of a pollution gradient with numbers of species increasing with distance from the outfall. Several algal species showed retarded or abnormal growth especially in the littoral region. Data are presented for the pH and free chlorine content of the sea water and possible reasons for the distribution of prominent species are discussed. (Katz)

BIOLOGICAL CONSIDERATIONS ON THE USE OF THERMAL EFFLUENTS FOR FINFISH AQUACULTURE,
Oceanic Inst., Waimanalo, Hawaii.
J. R. Sylvester.
Aquaculture, Vol 6, No 1, p 1-10, July 1975. 1 tab, 50 ref.

Descriptors: *Effluents, *Fish, *Aquaculture, *Fish farming, *Thermal pollution, *Temperature, *Warm-water fish, Water quality, Metabolism, On-site laboratories, Sampling.

The use of thermal effluents was suggested as a source of warm water to control and maintain a fish farm system within optimum thermal limits. High temperatures of thermal effluents would exert their primary effect on cultured organisms through increased activity and metabolism. Site studies in thermal effluents indicated that the principal fishes attracted to thermal effluent areas were warmwater species and that these fish could provide suitable culture animals. (Katz)

ELIMINATION OF HYDROCARBONS BY MUSSELS,
Instituto di Biologia del Mare, Venice (Italy).
V. U. Fossato.
Marine Pollution Bulletin, Vol 6, No 1, p 7-11, January 1975. 2 fig, 1 tab, 17 ref.

Descriptors: *Organic compounds, *Mussels, *Water pollution sources, *Water temperature, *Animal physiology, Laboratory tests, *Oil.
Identifiers: *Mytilus galloprovincialis, Elimination, *Tissue analysis, Bivalves, Bioaccumulation.

Mussels, Mytilus galloprovincialis, collected from hydrocarbon polluted areas of the Lagoon of Venice were transferred to the relatively unpolluted port entrance of Malamocco. Hydrocarbon elimination was rapid in the first 10-15 days but later was slow and incomplete: 12% of the initial content persisted in the tissue for 8 weeks. Elimination of hydrocarbons was independent of water temperature between 7.5-26 degrees C. but virtually ceased in one lot when the temperature abruptly dropped from about 11 degrees C to 4.5-6.0 degrees C. The biological half-life of hydrocarbons in the mussels was calculated to be 3 1/2+ days, but this related only to the initial rapid phase of elimination. (Katz)

THE GROWTH OF POSIDONIA AND THE URBAN POLLUTION IN THE GULF OF GIENS, (IN FRENCH),
Institut Scientifique et Technique des Peches Maritimes, Nantes (France). Service de Pollution.
P. Maggi.
Ann Inst Michel Pacha, Vol 5, No 1, p 1-11, 1972, Illus.

Descriptors: Europe, *Urbanization, *Water pollution sources, Erosion, *Accelerated erosion, *Sediment control, Sands, Plant breeding, *Water pollution treatment.
Identifiers: *France(Giens Gulf), Posidonia-Oceanica, Pollution, *Posidonia, Light sediment, *Urban pollution.

Studies were carried out in the Gulf of Giens (France), which receives a large amount of urban pollution. This pollution may be the reason for the disappearance over a large area of Posidonia oceanica, which played a large part in fixing the light sediments. This resulted in hollowing of the sea floor and severe erosion of the sand beaches. A solution aimed at stopping the sources of pollution is considered. The problem of reconquest of the light sediments is approached by an original method of P. oceanica reimplantation. An 18 mo. trial showed that slips of the plants take root firmly in a sand bottom.--Copyright 1975, Biological Abstracts, Inc.

FURTHER OBSERVATIONS ON THE EFFECT OF SODIUM SALT OF 2,4-D ON EARLY DEVELOPMENTAL STAGES OF CARP (CYPRINUS CARPIO L.),
Polish Academy of Sciences, Warsaw. Inst. of Experimental Biology.
E. Kamler, O. Matlak, and K. Srokosz.
Polskii Archiwum Hydrobiologii, Vol 21, No 3-4, p 481-502, 1974. 10 fig, 7 tab, 51 ref.

Descriptors: *Sodium compounds, *Salts, *Carp, *Herbicides, *2-4-D, *Fish physiology, *Growth stages, Larvae, Toxicity, Mortality, Growth rates, Feeding rates, Environmental effects, Behavior, Metabolism, Water pollution effects.
Identifiers: Pielik, Sublethal concentrations.

Acute tests (48 hrs) demonstrated that the herbicidal formulated product 'Pielik' is about twice more toxic than the pure sodium salt of 2,4-5. The mortality test was the least sensitive of all acute tests applied for Cyprinus carpio. Long-term tests were much more sensitive than the acute ones. 'Pielik' continuously applied in a concentration of 50 mg active ingredient/l caused delayed hatching, behavioral changes, feeding impairment, severe morphological disturbances, slower growth rate and finally mass mortality of larvae. The observed drop in oxygen consumption, with a simultaneous increase in respiratory quotient and lactic acid content, indicated that 'Pielik' impairs the metabolic aerobic processes in favor of the anaerobic ones. ## 5D. Waste Treatment Processes

REMOVAL OF SOLUBLE MERCURY FROM WASTE WATER BY COMPLEXING TECHNIQUES,
Virginia Polytechnic Inst. and State Univ., Blacksburg. Dept. of Chemistry.
D. L. Michelsen, J. A. Gideon, G. P. Griffith, J. E. Pace, and H. L. Kutat.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-244 890, $6.25 in paper copy, $2.25 in microfiche. Bulletin 74, Virginia Water Resources Research Center, Blacksburg, May 1975. 161 p, 37 fig, 29 tab, 111 ref. OWRT A-044-VA(3).

Descriptors: Mercury, *Waste water treatment, Milk, Rubber, *Ion exchange, Economics, Heavy metals, Anion exchange, Cation exchange, Absorption, Ions.
Identifiers: *Mercury removal, Complexing techniques, Xanthates, Keratin, *Tannery hair.

Milk proteins, xanthates, modified rubber products, and keratin in various forms can be used for the removal of ionic mercury from water systems. In particular, anionic and cationic ion-exchange products made from ground tire cord rubber compete very favorably with classical ion-exchange resins with regard to capacity and rate of pickup. Cow and pig hair selectively remove ionic mercury, and the performance with tannery hair based on equilibrium capacity, rate of removal, and pressure drop was as good as classical ion-exchange resins. Regenerative studies of ionic mercury from tannery hair with HCl and NaCl were successful, and a number of scale-up studies including economics were completed to illustrate how tannery hair might be used for the treatment of waste streams containing ionic mercury. Compared to the existing state of the art, the results were very encouraging.

**METHODS AND EQUIPMENT FOR THE TREATMENT OF SPENT OIL EMULSIONS (VERFAHREN UND ANLAGEN ZUR BEHANDLUNG VERBRAUCHTER OEL-EMULSIONEN),**
F. Rueb.
Wasser, Luft und Betrieb, Vol 19, No 7, p 415-419, 1975. 8 fig.

Descriptors: *Waste water treatment, *Industrial wastes, Oil wastes, Oily water, Separation techniques, Filters, Centrifugation, Electrolytes, Emulsions, Flocculation, Membrane processes.
Identifiers: Ultrafiltration.

Methods and equipment for the treatment of used oil emulsions are described. Emulsion breakage is accomplished by using separating agents and temperatures up to 80C; the resulting oil and water phases are separated by centrifugation. Water containing traces of oil is passed through a filter system containing wood chips and a separating agent to obtain water with a residual oil content of 20-25 mg/liter. The separating agent expenditure can be reduced by preliminary emulsion breakage by means of less expensive electrolytes or salts. A residual oil content of 20 mg/liter can be achieved by chemical separation, using salts, acids, or flocculants for emulsion breakage. A fully automatic and continuous process uses sulfuric acid for the hot emulsion, and neutralizes the separated water. Aluminum and iron sulfates, iron chloride, sodium hydroxide, and flocculation aids are used in a batch type flocculation process. Thermal processes, yielding water vapor and used oil, are usually combined with catalytic afterburners to reduce air pollution. Ultrafiltration through cellulose acetate or polyamide membranes, combined with preliminary filtration, is suitable for continuous or batch operation at low energy expenditure. (Takacs-FIRL)

**SEPARATION OF EMULSIFIED OIL FROM WATER,**
Rensselaer Polytechnic Inst., Troy, N.Y. Dept. of Chemical Engineering; and Rensselaer Polytechnic Inst., Troy, N.Y. Dept. of Environmental Engineering.
L. K. Wang, J. Y. Yang, and D. B. Dahm.
Chemistry and Industry, No 13, p 562-564, July 5, 1975. 40 ref.

Descriptors: *Industrial wastes, *Waste water treatment, *Emulsions, *Reviews, Oil wastes, Oily water, *Separation techniques, Equipment, Flotation, Adsorption, Chromatography, Filtration, Membrane processes, Absorption, Centrifugation, Evaporation, Freezing, Oxidation.
Identifiers: Bilge water, Refinery wastes, Steel manufacturing wastes.

Oil-water emulsions are found in waste effluent streams from many sources, including the discharge of bilge and balast water from ships, washrack and hanger waste water, petroleum refineries, rolling mills, and chemical processing and manufacturing plants. A review of the state-of-the-art development of alternative commercial techniques for separating emulsified oil is presented. Techniques include conventional flotation, precipitate flotation, adsorption flotation, magnetization, coalescence, chromatography, layer filtration, membrane filtration, absorption and adsorption, centrifuge and hydrocyclone treatment, sedimentation, chemical coagulation, heating, evaporation and distillation, crystallization or freezing, biological oxidation, clarification-flotation, and filtration-extraction-filtration. A brief description of each of these processes is given. Although there are many commercial devices available for the removal of emulsified oil from water, there is no one economical and efficient method. (Orr-FIRL)

**OPTIMUM DESIGN OF SOUR WATER STRIPPERS,**
Exxon Research and Engineering Co., Florham Park, N.J. Fractionation/Thermodynamics Section.
G. A. Melin, J. L. Niedzwiecki, and A. M. Goldstein.
Chemical Engineering Progress, Vol 71, No 5, p 78-82, June, 1975.

Descriptors: *Waste water treatment, *Industrial wastes, *Oil industry, Computer models, Economics, Capital costs, Operating costs, Ammonia, Hydrogen sulfide.
Identifiers: *Refinery wastes, *Sour water strippers.

Sour water stripping is an important process in the pollution abatement practices of petroleum refineries. Although the optimum design of sour water strippers had been of little concern until recently due to the relative ease of removing H2S, the more strict requirements for the removal of NH3 have necessitated research into optimizing the design. Computer simulations were used to examine the effect of various operating parameters on sour water stripper performance. The parameters included: steam-to-feed ratio; number of theoretical trays; feed tray location; feed temperature; distillate drum temperature and pressure; feed H2S and NH3 concentration levels. The steam-to-feed ratio and the number of theoretical trays are the two most important design parameters. The economic optimization of sour water strippers required information on the efficiency of tower internals (trays or packing), the operating costs (primarily the cost of steam), the effect of operating conditions on steam consumption, the operating limitation set by other process equipment, and materials selection. The most important factor in the optimum economic design of a stripper is to balance investment costs with operating costs. Because other contaminants present in waste water change the pH of the water and thus affect the stripping of H2S and NH3, it is necessary to determine what particular species are present and at what concentration levels. The optimum design for a sour water stripper will include more trays than are currently used a rectifying section, and the addition of a strong base near the bottom of a single stripper to aid in the removal of tied up NH3. (Orr-FIRL)
W75-11361

**SEQUENTIAL TREATMENT OF KRAFT PULP WASHING WASTEWATER BY PILOT PLANT-ACTIVATED SLUDGE TREATMENT, LIME TREATMENT AND ACTIVATED CARBON TREATMENT, (IN JAPANESE),**
T. Fujii, H. Kabeya, H. Kamishima, T. Kubo, and J. Hosokawa.
Shikoku Kogyo Gijutsu Snikenjo Hokoku. (Rep of the Gov Ind Res Inst, Skikoku), Vol 7, No 1, p 1-13, March, 1975. 10 fig, 8 tab, 15 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Pulp and paper industry, Activated sludge, Lime, Activated carbon, Pulp wastes, Pilot plants, Color, Water reuse, Chemical oxygen demand, Lignins.

A sequential treatment consisting of activated sludge treatment, lime treatment, and activated carbon adsorption treatment was tested on unbleached kraft pulp mill washing waste water in a pilot plant system. Activated carbon adsorption was performed on water pretreated by activated sludge and lime. The fixed-bed activated carbon adsorption column system consisted of six columns filled with graular activated carbon of 8-30 mesh. Each column was 2 m long with a diameter of 15 cm. The flow rate was 60 liters/hour. The quality of the raw waste water was about 400 ppm COD, about 280 ppm lignin, and about 2400 platinum units of color. Treatment by a combination of activated sludge and lime resulted in about 90 percent removal of the COD, about 85 percent removal of lignin, and about 90 percent removal of color. The activated carbon treatment of this pretreated effluent produced a colorless, extremely low COD water suitable for reuse. The adosprtion efficiency of each activated carbon adsorption column was also estimated. (Orr-FIRL)

**FLOAT-WASH FRACTIONATOR SAVES FIBRE AND WATER AT GRAND'MERE,**
Consolidated-Bathurst Ltd., Grand'Mere (Quebec).
K. Godin.
Pulp and Paper Canada, Vol 76, No 6, p 81-83, June, 1975. 5 fig, 1 tab.

Descriptors: *Waste water treatment, *Industrial wastes, *Pulp and paper industry, Water reuse, Suspended solids, Separation techniques, Equipment, Water consumption, Water conservation.
Identifiers: White water, Float-Wash Fractionator.

A pollution abatement program was initiated in 1973 at Consolidated-Bathurst's paper mill at Grand-Mere, Quebec. The Boxboard Department was found to be contributing more than its share to mill solids losses. Although the largest amount of solids losses within the Boxboard Department could be blamed on accidental spills, caused by equipment carelessness, and frequent grade changes, an appreciable amount of the ss loss was due to the white water overflows from the Board Machine itself. It was felt that the surplus white water could be used to replace the cold fresh water used on the flood showers, oxcillating high pressure showers, and trim squirts of the Board Machine. A Type A06 Float-Wash Fractionator was tested for its treatment of the white water. The fractionator consists of two steel vessels stacked one above the other and separated by a spray nozzles, six fractionating devices and an overflow pipe, an inlet header, an outlet for the coarse fraction, an outlet for the fine fraction, an automatic bleeding valve with associated vacuum control equipment, and a vacuum pump. Problems during the trial included: loss of vacuum control when replacing screens; water flowing into the vacuum signal line; erratic control of vacuum level; and splitting of screens. Almost all of the problems were solved by installing new screens of a polyamine material, instead of polyester screens like the old screens. The recycling of white water on the Board Machine has not created any ma

perating problems. Suspended solids losses, as a ercentage of production, have decreased dra- iatically. Fresh water consumption has been educed by about 300 gal within the Board Depart- ent. (Orr-FIRL)

tifiers: Land application, Spray irrigation, bined municipal and industrial wastes.

Pinellas Plant in west central Florida employs t 1150 people for the design, development and ufacture of specialty electronic and mechani- uclear weapons components. Industrial and cipal wastes from the plant are being treated system which utilizes two retention lakes cou- through a spray irrigation field with subsur drainage. The system, implemented in 1973, is ble of treating a maximum projected volume 5,000 gpd. The effluent meets the criteria of State of Florida Waste Treatment Standards produces water of sufficient quality for reuse n the treatment plant for the cooling towers and deionized water facility. Sanitary wastes are treated in an extended aeration activated sludge plant. After chlorination, the sanitary effluent is passed through underground piping where it joins the plant's industrial wastes which have been treated in a neutralization facility where the normally acidic pH is automatically adjusted by the addition of sodium hydroxide. The combined wastes enter the lake for an average retention time of 52 days. The first lake also contains floating aerators. Water from the first lake is withdrawn through a strainer sump by one of two alternately operating pumps. A timed programmer directs the water flow to any single row of sprinklers or to any combination of six rows, each containing eight sprinkler heads. Polyethylene pipes are installed between each row of sprinklers and are connected to another polyethylene pipe which discharges the field drainage into a sump. Water from the field sump is pumped into the second lake and retained an average of 65 days. The effluent released from this lake is controlled by a dam with a valved outlet and eventually enters a salt water bayou after flowing through a series of county drainage ditches. (Orr-FIRL)

**CITY, INDUSTRY FACE POLLUTION ABATEMENT TOGETHER,**
Camp, Dresser and McKee, Inc., Boston, Mass.
W. H. Ringer, and W. C. Freeman.
The American City, Vol 90, No 6, p 101-103, June, 1975. 4 fig.

Descriptors: *Waste water treatment, *Industrial wastes, *Municipal wastes, Activated sludge, Interceptor sewers, Screens, Landfills, Settling basins, Centrifugation, Sludge treatment, Filtration, Plastics, Pulp and paper industry, Cities.
Identifiers: Pressurized heat treatment, Vacuum filtration, Combined municipal and industrial wastes.

The new municipal treatment facility at Haverhill, Mass. will also treat wastes from plastics and paper board production. The sewage and industrial wastes will be collected by interceptor sewers and pumped to the treatment plant via a force main. Raw sewage will be passed through catenary-type mechanically cleaned bar screens. Grit and primary solids will be separated in primary sedimentation basins, concentrated by travelling bridge scrapers in the primary basins, and pumped to vortex-type separators and classifiers. Centrifugal separators will be used to separate grit from sludge. The primary sludge will be discharged to gravity thickeners. Secondary treatment will be an activated sludge system. Three aeration tanks will be built that can be used for conventional, completely mixed, or step activated sludbe treatment. Tank aeration and mixing will be effected by mechanical aerators; foaming will be controlled by an antifoam spray. The activated sludge will be passed to three clarifiers for separation of sludge from plant effluent. The effluent will be chlorinated prior to discharge into the river. The waste activated sludge will be thickened by flotation. Both the thickened primary sludge and waste activated sludge will be subjected to pressurized heat treatment in a low pressure, wet air system. The processes sludge will be dewatered on vacuum filters. Screening, grit, and processed sludge will be disposed of at the city landfill. Projected completion date of the plant is mid-1976; total project cost will be $30.5 million. (Orr-FIRL)
W75-11366

**METHOD FOR RECLAIMING INDUSTRIAL WASTES AND ELIMINATING POLLUTION,**
J. M. Haviland.
Canadian Patent 968,891. Issued June 3, 1975. The Patent Office Record, Vol 103, No 22, p 85, June 3, 1975.

Descriptors: *Waste water treatment, *Industrial wastes, *Patents, *Metals, Recycling, Chemical precipitation, Sludge treatment, Centrifugation.
Identifiers: Metal recycling.

A process for removing one or more metal compound contaminants from contaminated industrial waste water is described. The metal compound contaminants are precipitated from the waste water to form aqueous metal compound sludge. The sludge is allowed to settle, and is concentrated by centrifugation. The metal compound contaminants are reclaimed from the sludge for reuse as either the metal compounds or the free metals. (Orr-FIRL)
W75-11367

**WATCH THAT WATER,**
G. Cook.
British Steel, No 28, p 23-26, June, 1975. 2 fig, 1 tab.

Descriptors: *Waste water treatment, *Industrial wastes, *Water reuse, Steel, Cooling water, Biological treatment, Activated sludge, Recirculated water, Water consumption, Water conservation, *Recycling.
Identifiers: *Steel manufacturing industry, Air/water heat exchangers, Open evaporative cooling towers.

The Appleby-Frodingham Works of the British Steel Corporation uses recycling systems for all major water demands. Although by 1976 the output of steel from the plant will have increased by about 220 percent from 1972, the intake of freshwater will have increased by only 100 percent. Changes in the steelmaking process and careful consideration of all aspects of water conservation and pollution prevention account for the savings in water usage. A total cooling water flow of 900 cu m/min is handled by 41 separate systems which may be divided into two groups: systems in which the water is used only to remove heat, indirect cooling systems; and, combined cooling and cleaning systems, direct cooling systems. Air/water heat exchangers are being used in addition to open evaporative cooling towers. Treatment of the direct cooling waters which have absorbed solids from the processes as well as heat is performed in a biological treatment plant commissioned in June 1974. The effluents are collected in a large holding reservoir used to equalize fluctuations in effluent flow and quality in addition to providing storage for the temporary failure of collecting pipes or the treatment plant. The mixed liquor is treated by activated sludge and then clarified. The effluent from the clarifier is stored in a 'tidal storage' reservoir and discharged into the River Trent during a 4 hr period around each high tide. Sludge is thickened to about 3 percent w/w and then lagooned. The plant has made good progress toward achieving the required degree of treatment. (Orr-FIRL)
W75-11368

**DEHYDRATING INDUSTRIAL SLUDGES BY FILTRATION.**
Belgian Patent BE 821-579. Issued April 29, 1975. Derwent Belgian Patents Report, Vol W, No 20, p 2, June 24, 1975.

Descriptors: *Waste water treatment, *Industrial wastes, *Sludge treatment, *Filtration, *Patents, Flocculation, *Dehydration, Filters.

A method for dehydration of flocculated industrial sludges by filtration is described. The filter device consists of a supporting filter-bag structure of polyester or polyamide filaments lined with a nonwoven textile, preferably a needled felt or random web, made of synthetic fibers. The filters have a high efficiency and effectiveness for retaining small particles. They can be used for sludges from the ceramic, metallurgical, paper, and sugar industries, chipboard and vegetable preserve manufacturing, wire presses, slaughterhouses, latex waste waters, mirror polishing, stainless steel etching neutralization, electroplating, and dissociated emulsions. (Orr-FIRL)

**PLATING AND CYANIDE WASTES, (LITERATURE REVIEW),**
Weston (Roy F.), Inc., West Chester, Pa.
J. E. Germain, and S. R. Kellogg.
Journal Water Pollution Control Federation, Vol 47, No 6, p 1479-1483, June, 1975. 113 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Heavy metals, *Reviews, Water reuse, Recirculated water, Membrane processes, Ion exchange, Neutralization, Chemical precipitation, Adsorption, Analytical techniques, Sampling, Patents, Standards, Evaporation, Reverse osmosis, Activated carbon, Electrolysis, Ozone, Polymers, *Bibliographies.
Identifiers: *Metal plating wastes, *Cyanide wastes, Closed-loop plating, Freeze-crystallization, Effluent guidelines.

The 1973-74 literature concerned with the treatment of plating and cyanide wastes was reviewed. Topics covered include recycling and recovery, membrane processes and ion exchange, neutralization and precipitation, adsorption, cyanides, sampling and analytical methods, patents, and effluent guidelines. Countercurrent rinsing was used to effect water use reductions. Atmospheric evaporative towers, freeze-crystallization, mixing of alkaline and acid wastes, and neutralization/ precipitation/ion exchange are some of the methods used to form closed-loop plating processes. Plating wastes may also be treated by reverse osmosis, ion exchange, activated carbon adsorption, or FeS sludge adsorption. Cyanide wastes may be treated with H2O2., a cobalt-based catalyst and chloride-producting electrolytic cells, various electrolysis methods, electrodialysis, oxonation and ion exchange. Methods for the removal of heavy metals from waste water include a wool or silk filter treated with dilute alkali or dilute acid, treatment with a sulfur containing agent and diffusion through peat, or polymer addition. (Orr-FIRL)

**ACCELERATION OF BIOCHEMICAL TREATMENT OF WASTEWATER IN PETROLEUM REFINERIES,**
Ya. A. Karelin, D. D. Zhukov, I. A. Saidaminov, O. N. Klochkov, and M. A. Denisov.
International Chemical Engineering, Vol 15, No 3, p 560-562, July, 1975. 2 fig, 2 tab. Trans from Nefte Pererabotka i Neftekhimiya, No 9, 1974.

Descriptors: *Waste water treatment, *Industrial wastes, *Oil industry, Oil wastes, Municipal wastes, Sludge, Activated sludge, Aeration, Flotation.
Identifiers: Refinery wastes, Biochemical treatment, Pressurized flotation, Sludge thickening, Combined municipal and industrial wastes.

Pressurized flotation has been widely used in the treatment of petroleum products containing water, and for concentrating sediment and excess sludge. A two-stage biochemical treatment unit has been developed in which the first-stage sludge separator is a pressurized flotation unit. The unit consists of a Stage I aerotank-mixer, a flotation sludge separator, a Stage II aerotank-mixer, and a vertical settler. It treats refinery wastes and municipal sanitary sewage. A sludge dose of 15-16 g/liter is maintained in the Stage I aerotank-mixer. The sludge mixture is pumped from the aerotank to a pressure tank, saturated with air at a pressure of 3.0-3.4 kgf/sq cm, and passed through a reducing valve into the flotation chamber. The concentration of sludge in the surface water in the flotation tank is 30-33 g/liter; this is passed to the Stage II aerotank. Sludge is precipitated in the Stage II separator and transferred to a distributor tank. Part of the sludge from the distributor tank is combined with the sludge-air mixture from the pressure tank and then subjected to flotation and consolidation. The other part of the sludge is returned to the State II aerotank. Pressurized flotation produces a rapid separation of high-concentration sludge mixtures and return of a highly concentrated activated sludge to the aeration zone, thereby maintaining large doses of sludge in the aerotank. The oxidation capacity is increased, the time for sludge deparation is reduced, and the degree of sludge thickening is increased over conventional values by using this process. (Orr-FIRL)
W75-11371

**ADVANCED TREATMENT OF WASTE WATER FROM MACHINERY WORKS BY ACTIVATED CARBON (KASSEITAN NI YORU KIKAI KOJO HAISUI NO KODO SHORI),**
M. Kishi.
Yosui to Haisui, (Jour. of Water and Waste), Vol 17, No 8, p 1011-1015, August, 1975. 4 fig, 7 tab, 5 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Activated carbon, *Tertiary treatment, Biochemical oxygen demand, Chemical oxygen demand, Surfactants, Oily water, Oil wastes, Water reuse.
Identifiers: *Machinery factories.

The use of activated carbon as the advanced treatment method for waste water discharged from machinery factories was discussed. Biological treatment of this waste water was difficult since the BOD varied greatly. Typical machinery factories discharged waste water containing low BOD and COD in the range from 30 to 50 ppm as well as suspended oil residues and surfactants. The efficiency of activated carbon for the removal of GOD and COD was high if the waste water contained low levels of BOD and COD; about 80 percent COD removal could be expected. The activated carbon treatment would be most effective as the advanced treatment for waste water from machinery factories; the treated water is suitable for reuse. When the activated carbon method was applied to effluent from a machinery factory which treated its effluent by flotation followed by sand filtration, the quality of the treated water obtained was COD, 3.1 ppm, BOD, 5 ppm, ss, 5.3 ppm, and n-hexane extractable components, 0.9 ppm. The concentrations in the original waste water were COD, 16.8 ppm, BOD, 27.6 ppm, ss, 36.1 ppm, and n-hexane extractable components, 3.4 ppm. (Katayama-FIRL)

**STUDIES ON RECOVERY OF CHEMICALS AND MANUFACTURE OF ACTIVATED SUBSTANCES FROM PULPING WASTE LIQUOR, PART 2, USE OF SOFTWOOD KP-WASTE LIQUOR, (IN JAPANESE),**
Hokkaido Univ., Sapporo (Japan). Dept. of Applied Chemistry.
K. Tosaka, and J. Hayaski.
21Japan Tappi, Vol 29, No 6, p 40-47, June, 1975. 6 tab, 2 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Pulp and paper industry, Pulp wastes, Activated carbon, Color.
Identifiers: *Activated adsorptive substances, Kraft pulping waste liquor, Decolorization.

Studies were performed on the manufacture of activated adsorptive substances from softwood kraft pulping waste liquor. NaOH contained in the liquor was carbonated with CO2 gas and the concentrated matter was directly activated with Na2SO4 under several sets of conditions without carbonization. The activated substances prepared with 10 perdent Na2SO4 at 750 or 800C for one or two hours had a decolorization effect on the kraft pulp washing liquor comparable with or superior to the commercially available activated carbon 'Shirasagi'. The activated substances prepared with Glauber's salt or solution showed excellent relative efficiency but lower yield than the anhydride and were therefore considered unsatisfactory. The activated substances prepared at 750 or 900C also showed methylene blue adsorption and specific surface area comparable to those of 'Shirasagi'. (Orr-FIRL)

**TREATMENT OF WASTE WATER FROM TEXTILE DYEING PROCESS (SENSHOKU HAISUI SHORI),**
K. Tsukabayashi.
Yuki Gosei Kagaku Kyokai-shi, (Jour of Synthetic Organic Chemistry Japan), Vol 33, No 5, p 377-383, May, 1975. 5 fig, 8 tab, 12 ref

Descriptors: *Waste water treatment, *Industrial wastes, *Textiles, Dyes, Color, Chemical precipitation, Flotation, Filtration, Adsorption, Biological treatment, Biochemical oxygen demand, Ozone, Activated carbon.
Identifiers: Decolorization, Textile dyeing wastes, Zero discharge.

Treatment methods for waste water discharged from textile dyeing processes are reviewed. These are coagulation precipitation, flotation, filtration, adsorption, and biological methods. The coagulation precipitation method removes about 60 percent of the BOD and COD from the waste water, and 90 percent of the color. However, the large quantity of sludge generated is one of the problems with this method. The flotation method has a larger surface load capacity for waste water treatment than the coagulation precipitation method permitting the use of a smaller facility with the flotation method to achieve the same results as a larger coagulation precipitation facility. Both these methods are very effective in the decolorization of waste water. Selection of the appropriate coagulation agent will permit removal of most dyes. The adsorption method by activated carbon or bauxite is suitable as a secondary treatment method for waste water rather than as a primary method. The presence of chromium, copper, chloride, and aldehydes in waste water can be toxic to biological activity. Ozone treatment is excellent but very expensive; it can be used as a secondary treatment method. Any combination of these methods will produce water which will meet water quality standards. A completely-closed system of water/waste water is difficult to maintain in textile industries because of the high quality of water that is needed in some of the individual processes. (Katayama-FIRL)

**REDUCED COST FLOCCULATION OF A TEXTILE DYEING WASTEWATER,**
Saint Regis Paper Co., West Nyack, N.Y.
J. S. Kace, and H. B. Linford.
Journal Water Pollution Control Federation, V 47, No 7, p 1971-1976, July, 1975. 5 fig, 1 tab, ref.

Descriptors: *Waste water treatment, *Industr wastes, *Textiles, Dyes, Costs, Flocculatio Coagulation, Polyelectrolytes, Color, Aluminum
Identifiers: Disperse dyes, PEI 400.

The polyelectrolyte flocculation of a simulat textile waste water with and without the additi of coagulants was investigated. The two dispe dyes tested were Artisil Blue-Green and Art Red. Five polyelectrolytes were screened for th effectiveness in flocculating the dyes at a pH 7.0. The three cationic polyelectolytes examin were capable of achieving better than 90 perc color removal. The two anionic polyacrylami studied were not capable of achieving flocculat over a wide range of dosages. PEI 400 polyethyleneimine polyelectrolyte, was found require the lowest dosage to achieve effec flocculation. Studies of the flocculation of dyes with PEI 400 at pH 5.0 and 4.5 in an atte to reduce the polymer dosage required sho that the amount of polymer could be reduced

that a sharp optimum occurs at the lower pH values indicating that control of this flocculation system would be critical. A relatively low aluminum ion dosage was capable of reducing the residual color by coagulation to an acceptable level. A combined polymer and aluminum system was capable of achieving a color removal better (95 percent) than either chemical used alone with a low level of redispersion. A plot of the optimum flocculation points as Al(+++) dosage required versus PEI dosage required shows nearly a hyperbolic relationship between these ordinates, indicating that they are interacting synergistically. Filtration studies were performed to provide a measure of the filterability of the generated sludges. The results of the two dyes studied were similar. The filtration rate decreased as the amount of the aluminum hydroxide floc present increased. High percentage polymer flocs showed a relatively fast filtration rate. Costs are discussed for the tested combinations of treatment. (Orr-FIRL)

**STUDIES ON THE TREATMENT OF WASTE-WATERS FROM THE TOWEL DYEING INDUSTRY,**
H. Takechi, S. Kagawa, K. Senba, and S. Kurosaka.
Kogai, (Pollution Control), Vol 10, No 4, p 38-48, July, 1975. 14 fig, 9 tab, 13 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Textiles, *Dyes, Color, Aeration, Coagulation, Sedimentation, Chemical oxygen demand, Trickling filters, Activated sludge, Ozone, Activated carbon.
Identifiers: *Japan.

Studied were conducted on the treatment of waste water from the towel dyeing industry in Japan. In order to comply with the 1971 pollution regulations of Japan, it was necessary to install an overall storage tank for waste water from various sources. During a detention time of about one half day, the pH is maintained in the range from 6.5 to 8.0 by an automatic pH regulator. It was also necessary to install an aeration basin capable of aerating the waste water for about four hours in order to mix the waste water with air and increase the dissolved oxygen concentration. Coagulative sedimentation was investigated as a method for the reduction of chemical oxygen demand (COD). The addition of 500-600 ppm of aluminum sulfate, 3 ppm of a high polymer coagulant, and 2 ml/liter of an emulsion of calcium hydroxide achieved a COD removal of nearly 50 percent. However, the method is not recommended because of the large amount of sludge produced. Trickling filter processes and activated sludge were effective methods for COD reduction to below 100 ppm. Treatment with ozone to reduce the color content of waste water was tested. Ozonation was effective for waste water from factories using reactive dye, but was ineffective for those from factories using threne dye, naphthol dye, and/or sulfur dye. However, since about 90 percent of the dye used in the towel dyeing industry in the Ehime Prefecture is reactive dye, treatment with ozone is a viable method for this area. Treatment with activated carbon was also effective in the removal of color; the decoloration effect was greatly enhanced by the combined use of activated carbon with ozone. (Orr-FIRL)

**TREATMENT AND DISPOSAL OF ANODIZING EFFLUENTS, PART I,**
Grand Sheet Metal Products Co., Melrose Park, Ill. Croname Div.
R. Satee.
Products Finishing, Vol 39, No 10, p 75-79, July, 1975. 1 tab, 3 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Metals, Waste water disposal, Neutralization, Water reuse, Phosphates.
Identifiers: *Anodizing effluents.

Part one of an article dealing with the treatment and disposal of anodizing effluents discusses general treatment goals, processes found in such plants, consitituents of the waste water, and neutralization as an in-plant treatment operation. The type of equipment and testing facilities used are determined by the objective of the plant. Any modern anodizing plant will include the following baths: cleaners; bright dips; etchants; anoidizing; desmutting; sealing; and, conversion coating. The final waste water may contain phosphates, sulfates, chlorides, fluorides, chromium, nitrates, nickel, and aluminum. Design of an effective treatment system should begin with collection of waste water samples over a week of normal activity. Analysis of the samples will provide an average concentration range. The flow rate should also be determined. An estimate of the degree of pollution of the waste water can be obtained by comparison with raw water sources; notable increases are usually found in chloride, sulfate, phosphate, and nitrate along with substantial increases in chromium, nickel, and aluminum. After the metal hydroxides are precipitated and removed from the waste water, the main problem left is the removal of phosphates. Many anoidizing plants have a separate area or station where the additions for pollution control can be made continuously. Most anodizing plant waste after pH treatment will have an acceptable pH ranging from 7.0 to 7.5, due to the reaction of acidic constituents with alkaline solution from etching rinses. Since the rate of flow is known, the rate at which a solution of sodium hydroxide must be added to maintain a proper pH can be easily calculated. An example is given. (Orr-FIRL)
W75-11377

**TREATMENT AND DISPOSAL OF ANODIZING EFFLUENTS, PART II,**
Grand Sheet Metal Products Co., Melrose Park, Ill. Cronome Div.
R. Satee.
Products Finishing, Vol 39, No 11, p 68-73, August, 1975. 1 tab, 6 ref.

Descriptors: *Waste water treatment, *Industrial wastes, *Metals, *Waste water disposal, Flocculation, Phosphates, Coagulation. Lime, Chromium, Settling basins, Surface waters, Discharge(Water), Water reuse.
Identifiers: *Anodizing effluents.

Part two of an article dealing with the treatment and disposal of anodizing effluents discusses the addition and effectiveness of flocculating agents, phosphate removal by coagulation followed by lime treatment or treatment with trivalent metal ions, removal of hexavalent chromium, extra-plant facilities such as settling tanks, ponds, or lagoons, and discharge into surface waters which must include sampling and testing. Removal of metal hydroxides and other suspended solids from the final effluent can be achieved effectively and rapidly by the addition of certain organic polymers. The only advantages of lime treatment for phosphorus removal is that it is relatively inexpensive, and effective when stringent standards are not enforced. Disadvantages of the process are that the precipitation of phosphorus by lime is very slow; particles of the precipitate may behave like colloids; and, certain polymeric phosphates form soluble phsophate complexes with calcium. A highly effective treatment for phosphates removal involves the use of metal salts such as ferric or aluminum chloride or aluminum sulfate. Waste pickling liquors can be used for phosphorus removal. Batch treatment of hexavalent chromium employs sulfur dioxide, in the form of sodium metabisulfite, for the reduction of the hexavalent chromium to trivalent. Sulfur dioxide gas may be used for the continuous reduction of chromium in conversion coating wastes. Ferrous sulfate can also effectively reduce chromium. A series of ponds or lagoons can be used for the final treatment of the effluent before discharge into receiving water. The ideal method of treating water in an anodizing plant is for reuse within the plant. Sludge should be dewatered and disposed of at a landfill. Disposal of the effluent into surface waters requires an equalization tank and filtration systems. (Orr-FIRL)

**METHOD OF PURIFYING WATER,**
S. R. Kennedy.
Canadian Patent 968,893. Issued June 3, 1975. Patent Office Record, Vol 103, No 22, p 85, June, 1975.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, Potable water, *Neutralization, Iron, Aluminum.
Identifiers: Acidification, *Chemical treatment.

The patented method described may be used for purifying sewage or other polluted water to render it suitable for use as drinking water. The polluted water is acidified with a mineral acid such as sulfuric, nitric, hydrochloric, or mixtures thereof. This mixture is then treated with iron to produce an iron salt in situ, then neutralized. An iron or aluminum nitrate or sulfate may be added to the mixture when it is treated with the iron. **CONTINUOUS TREATMENT OF POLLUTED LIQUIDS.**
Australian Patent 460, 875. Issued May 8, 1975. Official Journal of Patents, Trade Marks and Designs, Vol 45, No 15, p 1690, May, 1975.

Descriptors: *Patents, *Waste water treatment, *Flocculation, Sedimentation, Sludge.
Identifiers: *Bioflocculation, Continuous treatment.

A method for the continuous treatment of polluted liquids has been patented. The liquid is first subjected to a bioflocculation process in a closed space. Part of the liquid along with the formed suspension is continuously removed and allowed to sediment by gravitation in an inclined sedimentation channel. A first stream of liquid with a diluted suspension is taken from the external part of the sedimentation channel for filtering through a perfectly fluidized sludge blanket. A second stream of the suspension concentrated by gravity is passed from the internal part of the sedimentation channel back into the bioflocculation chamber. The liquid which as passed through the sludge blanket is removed for further treatment. (Orr-FIRL)

**VACUUM SYSTEM FOR SEWAGE DISCHARGE IN KREMPEL (DISTRICT OF DITHMARSCHEN)-EXPERIENCE WITH A NEW KIND OF SEWERAGE (VAKUUMENTWAESSERUNG KREMPEL/DITHMARSCHEN- ERFAHRUNG-SBERICHT UEBER EINE NEUARTIGE KANALISATION),**
H. Drebes, and H. Ivers.
Wasser und Boden, Vol 27, No 5, p 115-118, May, 1975. 4 fig, 2 tab, 2 ref.

Descriptors: *Sewers, Waste disposal, Pumps, Storm runoff, Overflow, Personnel, Construction materials.
Identifiers: *Vacuum sewers, Waste discharge, Germany.

The new vacuum sewer system in Krempel, a village of 500 inhabitants in the district of Dithmarschen, West Germany, is described. Due to the lack of sufficient slopes, a vacuum system including waste water pumps, two vacuum pumps, collection tanks, and PVC pipes cost about 50% of a conventional gravitational system. Storm runoff is not provided for, and the storage capacity of the vacuum sewer system is limited. Emergency overflow is not possible. The valve-controlled connection shafts are 80 cm in diameter and 150 cm in height. All repair and maintenance work must be done by trained personnel to avoid damages and breadkown. (Takacs-FIRL)

**THE SPACE/TIME COEEFFICIENT METHOD FOR CALCULATION OF RAINWATER RUNOFF (DAS RAUMZEITBEIWERTVERFAHREN FUER DIE BERECHNUNG VON REGENWASSERABFLUESSEN),**
H. Schulz.
Wasserwirtschaft-Wassertechnik, Vol 25, No 3, p 99-101, March, 1975. 2 fig, 1 tab, 4 ref.

Descriptors: *Sewers, Runoff, Model studies, Mathematic studies, Hydraulics, Rainfall intensity.
Identifiers: Space/time coefficient.

The space-time coefficient method is a simple model for the approximate calculation of runoff retardations in sewer systems. The space-time coefficient method is based upon Fantoli's mathematical-hydraulical formulas, and represents a generalized simplification of the partial and total retention and translation relations of individual runoff curves. The highest obstruction-free runoff in the sewer system is generated by rainfalls whose duration equals the filling time of the sewer system. More prolonged rainfalls cause either obstruction or runoff under pressure after the filling time. The space-time coefficient curves are based on a computed rainfall for a frequency of n = 1 at a rainfall duration of 45 minutes. (Takacs-FIRL)

**PROCESS FOR TREATING WASTE WATER,**
Etudes et Procedes d'Assainissement Purator, Rennes (France). (assignee).
S. O. R. L. Lewandowski, and R. Lewandowski.
United States Patent 3,883,426. Issued May 13, 1975. Official Gazette of the United States Patent Office, Vol 934, No 2, p 737, May 1975.

Descriptors: *Patents, *Waste water treatment, Aluminum, Mercury, *Flotation, Water purification.
Identifiers: Alumina, Hydrogen gas.

A process for the purification of waste water has been issued a patent. The process involves mixing waste water and aluminum in a flotation zone. The flotation zone should have an amalgam of aluminum and mercury on at least one surface. The waste water is allowed to react with the amalgam to form hydrogen gas and alumina. Impurities are carried to the surface of the waste water by the evolved hydrogen gas and alumina and removed. The purified waste water is then recovered. (Orr-FIRL)

**AN EVALUATION OF THE EFFECTIVENESS AND APPLICABILITY OF PHYSICAL-CHEMICAL TREATMENT OF URBAN LAND RUNOFF,**
North Carolina State Univ., Raleigh.
P. Samar.
Available from University Microfilms, Inc., Ann Arbor, Mich. 48106. Order No 75-7712. PhD Thesis, 1974. 169 p.

Descriptors: *Waste water treatment, *Storm runoff, *Sludge, *Coagulation, *Alum, Design criteria, Urban runoff, Suspended solids, Chemical oxygen demand, Turbidity.
Identifiers: *Physico-chemical treatment.

Urban runoff was treated by a physico-chemical method of coagulation, flocculation, and sedimentation. Sludge handling was also developed, and sludge characteristics were evaluated by density, resistivity, and solid content of the sludge. The selection of an effective coagulant for physico-chemical treatment was investigated by assessing the parameters involved and by evaluating the criteria for effecient treatment. The parameters effective in the design were shown to be directly related to the type of coagulant used. Several organic and inorganic coagulants were evaluated in jar test analyses. The most efficient coagulants in terms of suspended solids removal, COD, and turbidity were found to be alum and the cationic polyelectrolyte Calgon 2660. Based on the parameters of initial suspended solids, alkalinity, and mixing conditions, alum was selected as the best coagulant for treatment of urban runoff. (Prague-FIRL)

**ENVIRONMENTAL CONSTRAINTS CHALLENGE DESIGNERS OF SHORELINE COMMUNITY NEAR KANSAS CITY, MISSOURI,**
Larkin and Associates, Kansas City, Mo.
G. C. Gray.
Professional Engineer, Vol 45, No 6, p 42-44, June, 1975.

Descriptors: *Waste disposal, *Sewage disposal, *Pumps, Planning, Recreation facilities, *Waste water treatment, Missouri.
Identifiers: *Pressure sewers, *Gravity sewers, Kansas City(Mo).

Waste disposal in a planned community near Kansas City, Missouri had been accomplished by septic tanks, with absorption field effluents being pipelined to a recreational lake. In 1917, planners decided to develop an alternate disposal method which would protect the Lake Weatherby quality, involving a sanitary sewer system. When a gravity sewer system with ultimate treatment at the Kansas City treatment facility was considered, project costs were found to be too high. A vacuum type sewer system would not be effective in waste treatment for this particular topographic condition. A pressure sewer system was then chosen, featuring small size pressure main lines constructed along the street rights-of-way, following the street profile at a shallow uniform trench depth, with a pump unit at each home, pumping into the main pressure line. The pump units consist of an integral grinder and are installed in an opening about four feet in diameter and five feet deep. The final design was a cost effective pressure sewer system constructed of SRD-26 (160 psi rated) PVC pressure pipe. The project included 309 grinder pump units, 35,000 linear feet of main pressure sewers, 37,100 linear feet of pressure service lines from pumps to street mains, 42 air relief valves, 24 flushing and cleanout connections, and 5300 linear feet of eight-inch gravity sewer for connection to existing Kansas City interceptor sewers. **SUFFICIENT WATER SUPPLY AND SEWER SYSTEM, AND EQUITABLE DISTRIBUTION OF THE COSTS (TILLSTREKKELIGE VANN- OG KOLAKKANLEGG-SAMT RETTFERDIG FORDELING AV KOSTNADENE),**
C. Smits.
Teknisk Ukeblad-Teknikk, Vol 122, No 15, p 41-42, April, 1975. 6 refs.

Descriptors: *Sewers, *Waste disposal, *Costs, Water pollution control, Water supply, *Pollution taxes(Charges).
Identifiers: *Sewer use charges, *Norway, Waste water discharge.

The new Water and Wastewater Fee Act, promulgated on January 1, 1975 in Norway, is described. A uniform fee system was designed to provide for a sufficient and dependable water supply, and to set the water and sewage fees to cover their respective costs, as well as to promote economization. Payment shall be for the actual, metered consumption. The sewage fee to be paid will be determined on the basis of water consumption assuming that the volume of the water consumed is equivalent to that of the waste water discharged into the sewer system. Special discounts will be available for users with installations providing water economy, as compared to conventional systems, and for those users who discharge waste water with very low pollution levels. (Takacs-FIRL)

**SEWAGE OXIDATION TREATMENT APPARATUS,**
R. N. E. Edwards
Netherlands Patent 75740V/43. Issued March 4, 1975. Derwent Netherlands Patents Report, Vol W, No 12, p 3, April 29, 1975.

Descriptors: *Patents, *Sewage treatment, *Waste water treatment, *Oxidation, Oxygen, Liquid wastes, Absorption.
Identifiers: Waste oxidation, Chemical oxidation.

A patent was granted to a liquid sewage and waste oxidation system. The apparatus is used for chemical oxidation of contaminants having a high degree of oxygen absorption and utilization. It is composed of an enclosed vessel divided into lower and upper portions. Inlet means for receiving liquid sewage wastes define a liquid level, and outlet means for discharging the treated liquid are found in the lower portion. Means are connected to the vessel to supply oxygen to the upper portion of the vessel. An oxygen rich atmosphere results, above the liquid level. A comminutor in the upper portion directs a stream of liquid sewage from the lower portion upward, to exit into the oxygen atmosphere. At the comminutor, the liquid waste is broken into a myriad of particles, thus increasing the interfacial area between the oxygen and sewage, where oxygen may then be readily absorbed. (Prague-FIRL)
W75-11395

**ACTIVATED SLUDGE SEWAGE TREATMENT FOR SEASONALLY VARIABLE THROUGHPUT,**
F. Ostreicher.
Belgian Patent 16070W/10. Issued February 1975. Derwent Belgian Patents Report, Vol W, No 10, p 2, April 15, 1975.

Descriptors: *Patents, *Waste water treatment, *Activated sludge, *Biological treatment, Facilities, Sewage treatment.
Identifiers: Sludge quantity(Seasonal), Stock ta

An activated sludge sewage treatment method is patented which is applicable to treatment of seasonally variable throughout, and may be sustained in low seasons with supplemental waste matter. In this biological treatment plant sewage is delivered into an activated sludge tank which will discharge a treated effluent. When the rate of sewage delivery is too low to sustain an adequate activated sludge level, supplemental sludge is infed from a stock tank. The tank is also filled when there are periods of excess sludge in the activated sludge tank. The activated sludge tank may be preceded by a decantation chamber and any deficiency in sewage supply is then made up by agitation of sediment in the decantation chamber, which causes suspended sediment to be carried over to feed the sludge tank. (Prague-FIRL)
W75-11396

**SEPARATING IONISED MATERIALS FROM AQUEOUS SOLUTIONS.**
German Patent 85847V/50. Issued March 27, 1975. Derwent German Patents Report, Vol W, No 14, p 2, March, 1975.

Descriptors: *Patents, *Waste water treatment, *Heavy metals, *Separation techniques, Ionization, Aqueous solutions.
Identifiers: Osmolarity.

A patented method suitable for treating freshwater, seawater, or waste water containing heavy metals is described. Ionized materials of differing chemical or physical properties are separated from aqueous solutions containing at least 0.5 mM mg and/or Ca and K by contact with small bubbles formed by complex-former containing living cells. Complex formers are admitted through the cell walls from a complex former absorbing solution, having an osmolarity below that of the contained cells. The osmolarity of the complex former containing solution is then increased by addition of osmolytically active materials such as Ca, K, and Na ions. Bubbles containing complex former are separated and added to an aqueous solution, until the ionizing materials migrate through the bubble membrane into the bubble. The ionizing materials are thus converted into complexes which dissolve or dissociate with difficulty. The cell bubbles are then separated from the aqueous solution. (Prague-FIRL)
W75-11397

**SEWAGE TREATMENT.**
French Patent 53421U/37. Issued February 7, 1975. Derwent French Patents Report, Vol W, No 12, p 10, January, 1975.

Descriptors: *Patents, *Sewage treatment, *Aeration, *Waste water treatment, Sedimentation, Separation techniques, Sludge treatment, Facilities, Activated sludge.
Identifiers: *Package treatment plants, Waste purification.

A package plant for treatment of sewage was patented. The plant is divided into separate aeration, stabilization, and sedimentation chambers. A digestion cavity is positioned beneath the stabilization chamber. Raw sewage and settled sludge from the stabilization chamber are introduced into the aeration chamber. Sewage solids are converted into a liquid suspension of activated sludge flocs. These are directed to the sedimentation chamber for separation. The separated solids then pass to the stabilization chamber and purified liquid is removed from the sedimentation chamber. (Prague-FIRL)
W75-11398

**SINGLE TANK SEWAGE TREATMENT PLANT,**
H. R. Kaelin.
German Patent 15826U/12. Issued February 27, 1975. Derwent German Patents Report, Vol W, No 10, February 27, 1975.

Descriptors: *Patents, *Sewage treatment, *Waste water treatment, Tanks, Control structures, Treatment facilities.
Identifiers: *Liquid turn-over device(LTD), Waste clarification.

A patent was issued for a single basin sewage clarification plant. This single tank installation has a liquid turn-over device (LTD) with two openings, an upwardly directed suction opening and a downwardly directed outflow opening. One or more supply lines for the feed of an oxygen-containing gas mixture terminates in the immediate suction region of the LTD. Control devices prevent a lowering of the liquid level below the level of the suction opening. Conveyor paddles are fitted at their leading edges with cutting edges and produce shear action. The paddles have a plane running vertically to the axis of rotation of the LTD. A simple LTD of non-adjustable height is reliable, almost noiseless, and provides sufficient turn-over and oxygen supply to even the lowest liquid layer. (Prague-FIRL)
W75-11399

**PROPOSED STANDARDS: LAND DISPOSAL OF EFFLUENTS,**
University of South Florida, Tampa. Dept. of Biology.
J. V. Betz.
Civil Engineering, ASCE, Vol 45, No 5, p 77-79, May, 1975.

Descriptors: *Waste water treatment, *Waste disposal, Effluents, Pre-treatment, Land management, Sewage treatment, Economics, Groundwater, *Water quality standards, Percolation.
Identifiers: Land disposal, Land application.

Advantages and areas of concern for and disposal of effluents are discussed. When proper pre-treatment is given to sewage effluent, thus eliminating nitrates, toxic metals, detergents, and pathogenic bacteria, the resulting effluent may be used to irrigate the soil and crops. Purification then takes place, encompassing: nutrient uptake capacity of vegetative cover; biochemical reactions caused by microorganisms in the soil; inorganic chemical absorption to some extent by non-living soil constituents; and, mechanical filtering effects of passing through the soil. Advantages of this type of land disposal include: pollutants being kept from surface waters; sewage water providing crop and vegetation fertilizer; nutrients being recycled back into the soil and water being recharged back into the ground. In addition, the process is more economical than advanced waste treatment. However, the quality of groundwater is threatened when land disposal is not properly regulated or enforced. Examples occur if: septic tanks are not properly installed and permit aquifer contamination; sewage sludge disposed of in landfills is not monitored; drainage wells dispose of unwanted stormwater from farmlands, streets, and polluted lakes, as well as some sewage plants; open dump leachate seep into groundwater; canals and flood control channels cut into underlying aquifers and permit salty or polluted water to contaminate groundwater; or if sewage treatment plant effluents are disposed of in lagoons, percolation, or evaporation ponds, and then seep underground. (Prague-FIRL)

**GREEN SYSTEMS FOR WASTEWATER TREATMENT.**
Environmental Science and Technology, Vol 9, No 5, p 408-409, May, 1975. 1 fig, 1 tab.

Descriptors: *Waste water treatment, *Water treatment, Aquiculture, Treatment facilities, Precipitation(Chemical), Spraying, Irrigation, Water reuse, Nutrient removal, Water quality control.
Identifiers: *Living filter concept, Biological systems, Secondary treatment, Rhine River, Blue Nile River, Spray irrigation.

Biological techniques may be successfully applied to the treatment of water and waste water. Such methods were described at the International Conference on Biological Water Quality Improvement Alternatives, held this spring at the University of Pennsylvania in Philadelphia. Traditional water treatment is achieved on a household scale in the Sudan where water from the Blue Nile is flocculated and clarified in a 20 liter jar with pounded seeds of the tree Moringa olifera. At the Krefeld water treatment facility in West Germany, polluted Rhine river water is given secondary treatment (following primary treatment) by pumping the water through the reeds to precipitate solids; sludge is then aerated and sprayed into a lagoon containing bulrushes. These bulrushes neutralize extreme pH values, reduce COD, and increase DO. Tertiary treatment may then follow by filtration through natural sand and gravel. In Holland, a similar reed-bulrush-polypropylene fiber system was developed. At Penn State University, waste water reuse with spray irrigation of treated municipal sewage effluent to a mixed hardwood forest has been practiced for twelve years. Called 'the living filter concept', this system is recommended as efficient and economical for small cities and suburbs with available land. At Woods Hole, Massachusetts, marine aquiculture systems are being considered for removal of nutrient-rich wastes, and perhaps to provide a new commercial crop. Other biological techniques suggested include the use of biological 'filters', such as fresh water plants, invertebrates, and fish to control influent pH, and to improve organic, mineral, and bacteriological water quality. **STUDIES OF THE BIOCHEMICAL FACTORS CONTROLLING THE FLOCCULATION OF ACTIVATED SLUDGE, (IN JAPANESE),**
Y. Magara, and Y. Nanbu.
Gesuido Kyokaishi, (Jour. of the Japanese Society of Sewerage), Vol 11, No 126, p 5-11, 1974. 20 ref.

Descriptors: *Activated sludge, *Flocculation, *Sewage treatment, *Waste water treatment, Sedimentation, Organic matter, Efficiencies.
Identifiers: External cellular parts(ECP), Poly-beta-hydroxybutyric acid.

Flocculation and sedimentation of activated sludge in sewage water treatment were studied in relation to poly-beta-hydroxybutyric acid (PHB) produced within cellular parts of microorganisms in the activated sludge particles, organic matter produced at external cellular parts (ECP), and the electrophoresis value of solution. Three different types of the Pasveer's artificial sewage water were used. These were 0.135, 0.350, and 0.750 kg BOD/kg MLSS day. Both PHB and ECP levels decreased with increased average TOC staying time, and the absolute electrophoresis value of solution increased with the decreased PHB and ECP levels. Since the ECP are considered to have a carbonyl group, the sludge particles have negative charges and the electrical repulsive force between particles increases with higher ECP level, causing lowered flocculation and sedimentation. Thus the ECP was thought to be the main factor responsible for the efficiency of flocculation. Flocculation and sedimentation become poorer with higher concentrations of organic matter in the sewage water. This is explained from the fact that the average TOC staying time decreases since the average sludge staying time shortens with more organic matter per unit weight of activated sludge. **THE PHYSICO-CHEMICAL TREATMENT OF CRUDE SEWAGE,**
J. McKendrick, and E. R. Swart.
Water Pollution Control, Vol 74, No 2, p 155-159, 1975. 4 tab, 6 ref.

Descriptors: *Pilot plants, *Waste water treatment, *Sewage treatment, Activated carbon, Alum, Clarification, Filtration, Ammonium.
Identifiers: *Physico-chemical treatment, Crude sewage, Nitrogen removal, Zeolites, Clinoptilolite, *Rhodesia.

A pilot plant for physico-chemical treatment of crude sewage is being planned in Rhodesia. This

process is designed to overcome some of the problems of the land irrigation of final effluents, especially for this type of area which has seasonal rainfall, and relies on storage dams for adequate water supply. In addition, physico-chemical processes can be more immediately corrected for changes in sewage quality than can biological ones. The proposed method consists of flocculation of raw sewage with alum, clarification, sand filtration, and activated carbon treatment. Ammonia and total nitrogen removal from the activated carbon effluent presents the greatest problem. Laboratory trials resulted in 99.7% ammonia removal with the use of the naturally occurring zeolite clinoptilolite. This level is well below Rhodesian Water Pollution Regulations, but use of this treatment depends upon whether natural clinoptilolite can be found in Rhodesia or whether a resin with similar characteristics can be economically synthesized. (Prague-FIRL)

**AMMONIA REMOVAL FROM MUNICIPAL WASTEWATERS BY ION EXCHANGE,**
Associated Water and Air Resources Engineers, Inc., Nashville, Tenn.
J. H. Koon, and W. J. Kaufman.
Journal Water Pollution Control Federation, Vol 47, No 3, p 448-465, March, 1975. 14 fig, 9 tab, 23 ref.

Descriptors: *Ion exchange, Economics, *Ammonium, *Waste water treatment, Municipal wastes, Costs.
Identifiers: *Zeolites, *Clinoptilolite.

The conditions under which the zeolite ion exchanger clinoptilolite is most effective and economical for ammonia removal from waste waters were investigated. Experimental results were cited for defining optimum operating parameters for clinoptilolite exchangers and for estimating the cost of ammonia removal with clinoptilolite. It was found that the ammonium exchange capacity of clinoptilolite in domestic waste water treatment may be estimated from the cationic strength of the column influent. While total ammonium exchange capacity for Na- and Ca-clinoptilolite were identical, breakthrough capacity was more than two times as great for Na-clinoptilolite, probably because of the greater mobility of the smaller sodium ion in the zeolite pores. The total cost for ammonium removal with clinoptilolite for a 10 mgd plant was estimated to be $0.101 per 1000 gallons when regenerant is reused and $0.163 per 1000 gallons when regenerant is used only once. (Prague-FIRL)

**INSTRUMENTAL INVESTIGATION OF BIOLOGICAL WASTE WATER TREATMENT (A SZENNYVISEK BIOLOGIAI TISZTITASANAK MUSZERES VIZSGALATA),**
S. Fekete.
Kemiai Kozlemenyek, Vol 42, p 277-283, 1974.

Descriptors: *Instrumentation, *Biological treatment, *Waste water treatment, Phenols, Oxidation, Measurement, Biodegradation, Analytical techniques, Pollutant identification.
Identifiers: *Electrolytic cells.

A method and an automatic instrument for the measurement of the respiration of bacteria as a parameter of biological waste water treatment are described, as well as measurement data concerning the biodegradation of phenol in waste water. The instrument is composed of a closed reactor vessel with carbon dioxide absorber for the activated sludge sample, and a communicating electrolytic cell with properly profiled electrolytes for oxygen generation as a function of the respiration intensity of the bacteria. The respiration intensity is measured as the current intensity of the electrolytic cell. Measurements in phenol-contaminated waste water revealed a prolonged adaptation period preceding the aerobic microbial oxidation of phenol. The adaptation time increases with the phenol concentration in the waste water, and with the phenol load of the activated sludge. The oxidation peak was demonstrated to be in proportion to the phenol concentration. (Takacs-FIRL)
W75-11407

**AN AUTOMATED SPECTROPHOTOMETRIC SUSPENDED SOLIDS ANALYSIS FOR ACTIVATED SLUDGE,**
Municipality of Metropolitan Seattle, Renton, Wash. Renton Treatment Plant.
R. E. Finger, and B. J. Strutynski.
Journal Water Pollution Control Federation, Vol 47, No 5, p 1043-1054, May, 1975. 11 fig, 4 tab, 15 ref.

Descriptors: *Activated sludge, *Biological treatment, *Suspended solids, *Waste water treatment, Colorimetry, Automation, Sampling, Measurement, Analytical techniques, *Pollutant identification, *Spectrophotometry.
Identifiers: *Sludge volume index.

The measurement of suspended solids (ss) concentration in biological waste treatment is used as a primary control for process adjustment. The ss measurement is necessary for calculation of cell residence time, organic loading, and sludge volume indexes. The determination of types of polysaccharides associated with activated sludge and their effects on the physical characteristics of sludge have been investigated by a simple colorimetric test. The purpose of this study was to consider the possibility of adapting this test to an automated procedure. A manual colorimetric procedures which takes two or three hours was first tested and it proved to effectively measure mixed liquor suspended solids and vss. The automated spectrophotometric ss test takes only fifteen minutes and was demonstrated to be practical for use on a continuous basis. The major problem with the technique is sampling, which may be improved by the installation of a homogenization system. (Prague-FIRL)

**THE USE OF COMPUTERS FOR FORECASTING THE SANITARY SYSTEMS OF WATER BODIES (PRIMENENIYE EVM DLYA PROGNOZIROVANIYA SANITARNOGO SOSTOYANIYA VODOYEMOV),**
Ya. I. Vaysman, N. V. Zaytseva, B. M. Krasovskiy, and A. V. Mikhaylov.
Gigiyena i Sanitariya, No 9, p 102-104, 1974.

Descriptors: *Computers, Surface waters, *Forecasting, Hydrologic aspects, Water treatment, *Waste water treatment, *Pollutant identification.
Identifiers: Waste discharge, *USSR.

A computerized method for forecasting the sanitary status of surface water bodies is presented. Factors characterizing the dynamics of waste water discharges and their quantitative and qualitative parameters during the investigation period, the technological water treatment measures to be taken for pollution abatement, as well as the dynamics of the hydrological parameters of the water body were chosen as input data. The algorithm elaborated permits the determination of the concentration of one or more pollutant components as a function of time and of the size of the water body. It also determines the probability of the occurrence of definite pollutant concentrations. The algorithm was tested for the chloride load of the Kama river in the USSR. (Takacs-FIRL)

**BREAKTHROUGH IN SEWAGE TREATMENT--CASH, LAND, AND ENERGY SAVED.**
Water Services, Vol 79, No 950, p 132, 140, April, 1975. 3 fig

Descriptors: *Waste disposal, *Pilot plants, Effluents, *Sewage treatment, Biological treatment, Municipal wastes, Industrial wastes, *Waste water treatment.
Identifiers: *Underground disposal, *Deep Shaft Effluent Treatment Process

A method of underground treatment of both municipal and industrial effluents has been developed which will reduce the size of sewage works in half, operate them at lower costs, and produce 50% of the present amount of sludge. Called the ICI Deep Shaft Effluent Treatment Process, the basis of the system is a shaft hundreds of feet deep, partitioned into two sections. A pilot plant has been operated successfully since mid-1974 by the Northumbrian Water Authority, in Great Britain. In the process, sewage effluent enters the shaft continuously, is circulated through the sections of the shaft several times, then overflows by gravity for separation of solids. Biological oxidation is promoted by the compressed air that is also the driving force for the circulating the liquid effluent. The depth of the shaft determines the efficiency of oxygen transfer. Conventional drilling techniques are used for construction of the system. In all but optimal geological conditions, the hole must be lined with either concrete or steel and the annulus between the lining and the rock must be pressure grouted or filled with cement grout, because the lining carries the load from the rock and the hydrostatic heads. ICI recommends their process as a land-saving method for use in densely populated areas, and for treatment in cold climates where slow treatment rates have been a persistent problem. (Prague-FIRL)

**STORM AND COMBINED SEWER ABATEMENT TECHNOLOGY IN THE UNITED STATES--AN OVERVIEW,**
Environmental Protection Agency, Washington D.C. Municipal Pollution Control Div.
F. J. Condon.
In: 3rd U.S.-Japan Conference on Sewage Treatment Technology, February 12-16, 1974, Tokyo Japan, p 505-546. 4 fig, 16 tab.

Descriptors: *Storm runoff, *Urban area, *Combined sewers, Sewerage, Waste discharge, Treatment, Urban hydrology, Effluents, Water pollution control, Mathematical models, *Waste water treatment, United States.
Identifiers: Non-point pollution sources, Storm Water Management Models.

An overview of principal sources of runoff induced pollution as investigated by the Office of Research and Development of the United States Environmental Protection Agency is given. These include: combined sewer (domestic sewage and runoff) overflows, sewered storm water discharge, sanitary sewers surcharged by infiltration, treatment works or pump station bypass, and urban non-point or overland runoff. Remedial solutions for these specific causes must include urban hydrology as well as sanitary engineering. Schematic diagrams of urban hydrologic systems have been developed. In evaluating water pollutant loading, strength and mass emission of pollutants from an event must be considered. Projects for control include quantity reduction (infiltration control), quality improvement (deicing methods, runoff rate attenuation (porous pavements), improved materials (electro-magnetic subsurface profiling) for urban areas. Possible alternatives for effluent management facilities are also detailed. Treatment may be physical, physico-chemical, biological, or biophysical. The well-developed mathematical Storm Water Management Model and associated work are outlined as the principal tools for use in application of a total system

cept for selecting water pollution control alternatives. (PraguenFIRL)
W75-11414

**ELIMINATION OF WATER SURFACE POLLUTION.**
Australian Patent 458,317. Issued February 27, 1975. Official Journal of Patents, Trade Marks, and Designs, Vol 45, No 6, p 542, February 1975.

Descriptors: *Patents, *Waste water treatment, *Water pollution control, *Organic wastes, Pollutants, Organic wastes.
Identifiers: *Chemical treatment.

A patent has been issued for a composition that can be used for the elimination of water surface pollution. The composition is in a granular or powdered form and is suitable for concentrating organic pollutants on the surface of a body of water. The components of the composition include a carrier having an apparent density of less than one g/cc, a wetting agent consisting of a mono or polyhydric alcohol, and a surface active agent having a hydrophilic group other than a hydroxyl group. In each 100 parts by weight of the three components, there are 10-90 parts carrier, 1-10 parts wetting agent, and 9-80 parts surface active agent. (Orr-FIRL)

**FILTRATION AND PURIFICATION OF CONTAMINATED WATER,**
A. Schreiber, B. Schreiber, and E. Schreiber.
Canadian Patent 959,980. Issued December 24, 1974. Patent Office Record, Vol 102, No 52, p 85, December 24, 1974.

Descriptors: *Patents, Filtration, *Waste water treatment, *Trickling filters, Sludge treatment, Waste disposal, Water purification.
Identifiers: Waste discharges.

A process for the filtration and purification of contaminated water by means of a trickling filter was patented. A wear-resisting filler material having a specific gravity of approximately one or below is employed. Sludge adhering to the filler material is removed by first filling the material with flushing or scavenging water, then agitating the filler material, sludge, and added water. During agitation, the greater part of the sludge is discharged, mixed with water. The flushing water is then discharged, along with any sludge it contains, after which the trickling filter may be utilized again. (Prague-FIRL)
W75-11418

**OPEN WATER PURIFICATION SYSTEM,**
J. Rafael.
French Patent 32834V/18. Issued August 2, 1974. Derwent French Patents Report, Vol 40, No 3, p 3, November 12, 1974.

Descriptors: *Water purification, *Patents, *Oil spills, Water treatment, Plastics, Tanks, Flocculation, Separation techniques.

An open water purification system was patented. The system is versatile and has a high treatment capability, such as for the cleaning up of oil slicks. Two positions are used with their internal tanks coupled by an elongated flexible plastics walled duct. The duct acts as a flocculation dwelling chamber for raw water, taken in at the bow of the first position, and mixed in the tank of that position with a flocculating agent injected into it from an on-board preparation tank. The second position contains a separation system for the precipitated sludge and an aft discharge port for the treated water. (Prague-FIRL)
W75-11419

**USE OF OXIDIZED CATIONIC STARCH IN FLOCCULATION AND DEWATERING OF MUNICIPAL SLUDGE,**
Anheuser-Busch, Inc., St. Louis, Mo. (assignee)
W. G. Hunt, and R. J. Belz.
United States Patent 3,875,054. Issued April 1, 1975. Official Gazette of the United States Patent Office, Vol 933, No 1, p 338, April 1975.

Descriptors: *Patents, *Sewage treatment, *Sludge treatment, *Flocculation, *Waste water treatment, Municipal wastes, Sewage sludge.
Identifiers: *Starches.

A method was patented for treating raw primary sedimented sewage sludge. Its steps include the addition of from 0.016% to 0.1875% by weight (based on the dry weight of the sludge) of gelatinized oxidized cationic starch ether of amine butene halide to the raw sludge. The starch ether should have a carboxyl content equivalent to a degree of substitution of 0.0036 to 0.0108 and a degree of substitution of amine butene halide of about 0.15 to 0.25. The sludge is flocculated and then dewatered to below about 70% moisture. (Prague-FIRL)

**ELECTROLYTIC CHLORINE USED TO PURIFY DISINTEGRATED SEWAGE.**
Belgian Patent 1442W/09. Issued January 16, 1975. Derwent Belgian Patents Report, Vol W, No 9, p 2, April 8, 1975.

Descriptors: *Waste water treatment, *Patents, *Biological treatment, Suspended solids, *Sewage treatment, Bacteria, Biochemical oxygen demand, Odors, Chemical oxygen demand.
Identifiers: *Electrolytic chlorine, Sewage purification.

A patent was granted for electrolytic chlorine used to purify disintegrated sewage. Sewage containing a chloride of an alkali metal in solution is run into a first chamber. There suspended solids are broken down by a high speed disintegrator while an immersed anode and cathode subject the liquid to electrolysis evolving chlorine. The treated liquid suspension is transferred to a second chamber to be further mixed by an agitator before discharge from an outlet. Electrolysis should be continued in the second chamber. The system may be used in the purification of waste water or sewage to reduce the BOD, the COD, bacteria, and malodors to a level acceptable for discharge to rivers, canals, lakes, or the sea. (Prague-FIRL)
W75-11422

**FILTER FOR PURIFICATION OF WASTE WATER.**
an Patents Report, Vol 5, No 46, p 2, October 1974.

Descriptors: *Waste water treatment, *Patents, *Filters, Sludge, Microorganisms, Aeration, Filtration.

A filter was patented for the physical and/or biological purification of waste water. The sewage or waste water is allowed to trickle for a limited period over the filter bed, thus building up a layer of sludge and microorganisms. Grains covering the filter bed are circulated periodically and the sludge removed. To increase the efficiency of this sludge removal process, the waste water is distributed uniformly over the whole of the filter bed by rotating distribution arms. The grains, with diameters of about 6 mm are kept in a reservoir, resting on a concrete base. Arms for washing and sludge recovery rotate around two pipes; one admits compressed air and the other evacuates sludge. The biological layer of the grains is thus aerated and the circulation of the filter grains prevents clogging. (Prague-FIRL)
W75-11423

**SLUDGE DEWATERING INSTALLATION.**
Netherlands Patent 74332V/43. Issued October 23, 1974. Derwent Netherlands Patents Report, Vol 5, No 45, p 3, December 1974.

Descriptors: *Patents, *Sewage treatment, *Dewatering, *Sludge treatment, Drainage, *Waste water treatment.

A patent was granted to a sludge dewatering installation. Straining tanks are used for dewatering industrial wastes, municipal wastes, or sewage and consist of skips with sloping sides, lined throughout with wire mesh grilling. These are supported so as to leave space for drainage to bottom outlets, from the surface of settling sludge. The skips are easily transportable by skip-lorries, to dumping or disposal sites. This eliminates manual transfer from tank to transport. The installation is economical in terms of site space required, and may be located at the sludge source. (Prague-FIRL)
W75-11424

**WASTE WATER TREATMENT SYSTEM WITH AN OZONE GENERATOR,**
S. Koigawa, and M. Furuse.
Japanese Patent 49-27714. Applied March 4, 1970. Issued July 27, 1974. Japan Model Utilities. 1 fig.

Descriptors: *Waste water treatment, *Ozone, *Patents, Equipment, Mixing.
Identifiers: *Ozone generator, Mixing efficiency.

A waste water treatment apparatus equipped with an ozone generator was patented. The ozone generator is enclosed within the reaction bath of the apparatus and is thus cooled effectively by the surrounding waste water. The generated ozone is collected at the top of the generator and bubbled through from the bottom of the reaction bath. Spiral fines are attached outside of the ozone generator, which increases the mixing efficiency between ozone and the waste water. (Katayama-FIRL)
W75-11426

**DOMESTIC WATER PURIFICATION METHOD AND SYSTEM,**
Inca-One Corp., Los Angeles, Calif. (assignee)
J. D. Zeff.
United States Patent 3,843,521. Issued October 22, 1974. Official Gazette of the United States Patent Office, Vol 927, No 4, p 1637, October 1974. 1 fig.

Descriptors: *Patents, *Ozone, *Water purification, Domestic water, Equipment, *Waste water treatment.
Identifiers: *Ozone generator.

A patent was given for a household ozone generator and purification system, used for the purification of small quantities of impure water. It consists of a housing; an ozone generator mounted in the housing; means secured to the housing for energizing the ozone generator for preselected time intervals; and an open topped container with an impeller adjacent to its base. A cap for this open top defines an opening and means for mounting the housing on the cap permit ozone to flow through the cap and into a container. Thus, when the impeller is rotated, ozone is generated and flows into the container, purifying the domestic water. (Prague-FIRL)
W75-11427

**REMOVING SOLIDS FROM SEWAGE.**
U.S.S.R. Patent SU 407842. Issued December 10, 1973. Soviet Inventions Illustrated, Vol 5, No 41, p 2, September 19, 1974. 1 fig.

Descriptors: *Patents, *Sewage treatment, *Ammonia, Temperature, *Waste water treatment.
Identifiers: Solids removal, Cooling agents.

A patent for a method of removing solids from sewage was issued which involves freezing with a cooling agent such as ammonia and subsequently thawing and reliquifying the ammonia. Energy consumption is reduced by liquifying the cooling agent in two stages using high and low pressure compressors in series. Ammonia is fed along a pipeline to a crystallizer/evaporator where it evaporates, drawing its heat from the sewage residues which have been poured into the vessel and frozen. Ammonia vapor passes along by the low-pressure compressor and condenses from the pressure of boiling ammonia to the pressure of intermediate condensation in the condenser/meter. Heat transfer takes place, and the previously-frozen residues melt. The high pressure compressor removes the vaporous ammonia from the condenser-melter, raising the pressure to that of the high-temperature condenser. Excess heat is transferred from the condensation temperature of the cooling agent to that in the condenser. The result is that the cooling agent liquifies and is once more conveyed by a pipeline into the crystallizer/evaporator and the cycle is repeated. (Prague-FIRL)
W75-11428

**BIOLOGICAL PURIFICATION OF TOWN AND INDUSTRIAL EFFLUENTS.**
French Patent 11432W/07. Issued December 20, 1974. Derwent French Patents Report, Vol W, No 7, p 3, March 1975.

Descriptors: *Biological treatment, *Municipal wastes, *Industrial wastes, *Waste water treatment, Bacteria, Anaerobic treatment, Secondary treatment, Sludge treatment, Effluents.

A biological purification treatment method was patented which has been applied to rural, municipal, and industrial effluents. The effluent is seeded with bacterial strains, selected according to the nature of the effluent. The wastes are subjected to conditions which allow anaerobic and/or aerobic degradation of the organic matter. The effluent is coarse-screened and transferred to the primary settling tank where it is seeded with freeze-dried bacteria; corresponding natural enzymes and certain wetting agents are added. Anaerobic degradation occurs and after one to three days the effluent is collected from the upper part of the tank by passage along a pipe to an oxidation tank equipped with a projection turbine. After a period of twelve hours to twenty days, according to the degree of pollution, the effluent goes to a secondary settling tank where mineralized sludge is deposited. The treated effluent thus passes out by the overflow. (Prague-FIRL)
W75-11429

**IRRADIATION PLANT FOR FLUID MATERIAL, PARTICULARLY SEWAGE SLUDGE.**
German Patent 12845W/08. Issued February 13, 1975. Derwent German Patents Report, Vol W, No 8, p 2, February 1975.

Descriptors: *Patents, *Sewage treatment, *Irradiation, *Treatment facilities, *Sludge treatment, *Waste water treatment, Sewage sludge.

A plant for irradiating fluid material, particularly sewage sludge, was patented. Radioactive sources comprise an irradiation chamber through which the material flows. The equipment is provided with a container for a series of radiation sources, having channels for the introduction and withdrawal of these sources, which can be closed off and sealed against the fluid material. A common closure piece is provided for closing the channels and can be pressed down onto the radiation source container by a clamping retaining element. The closure piece is more reliable than individual closure elements and the radiation sources can be exchanged in a much shorter time; the danger that more than one channel is not completely sealed is considerably reduced. (Prague-FIRL)

**FLOTATION AERATOR FOR AERATING AND MOVING WATER,**
R. A. Cramer, Jr.
United States Patent 3,865,909. Issued February 11, 1975. Official Gazette of the United States Patent Office, Vol 931, No 2, p 859, February, 1975. 1 fig.

Descriptors: *Patents, *Aeration, *Flotation, Equipment, *Water treatment, *Waste water treatment.
Identifiers: *Flotation aerator.

An apparatus for aerating a body of water was patented. The process consists of propelling a stream of water from the body upward and outward above its surface. A float member of substantial area serves as a support, having through it a central opening with a vertical axis. A ring member is positioned in and encases a central opening and defines a vertical water flow passage. Motor supports are spaced on the ring member. A submersible motor is carried by its supports, spaced below the float member; the motor has a power shaft axially aligned with the flow passage. A propeller and diffuser are used to impinge upon a stream of water and to disperse the water upward and outward over a wide area. (Prague-FIRL)
W75-11439

**INCINERATOR DEVICE AND A METHOD OF PROCESSING RESIDUALS IN WASTE WATER, LIQUEFIED SEWAGE AND SLUDGE,**
Klein (Albert) KG, Niederfischbach (West Germany). (assignee).
W. Bastgen.
United States Patent 3,871,285. Issued March 18, 1975. Official Gazette of the United States Patent Office, Vol 932, No 3, p 851, March, 1975. 1 fig.

Descriptors: *Patents, *Incineration, *Waste water treatment, Sewage treatment, Equipment, Sludge treatment.
Identifiers: Granulation.

A device was patented for incinerating granulated combustible material. At least one sieve-type grate feeds combustible material; the grate is in the form of a rigid plate-shaped member with spaced perforations. The peripheral outline in each perforation is small in relation to the total area of the plate-shaped area. Supply means continuously feed air to the grate from below, thereby cooling the grate. Residuals are dried preliminarily by applying pressure; the predried residuals are granulated, maintaining a bed of hot air above the grate. The granulate in the form of a layer is guided along the hot air bed, and swinging movements to the layer cause the granulate to dip intermittently into the hot air bed. (Prague-FIRL)
W75-11440

**LIQUID TREATMENT PLANT AND PROCESS PARTICULARLY FOR WASTE WATER,**
J. E. Chatfield
Canadian Patent 962,386. Issued February 4, 1975. Patent Office Record, Vol 5, p 82, February, 1975.

Descriptors: *Patents, *Phosphorus, *Waste water treatment, Treatment facilities, Pollutants, Lime, *Coagulation, *Flocculation.

A patent was issued for a treatment process and plant which are adaptable and can be placed within a compact package unit. The process is designed to efficiently remove phosphorus and other pollutants from waste water. In the treatment process lime or another chemical coagulant is mixed with an influent solution to coagulate the solute and to flocculate the suspended particles in a flocculation chamber. There the mixture is raised through a field of suspended particles and reseeded with deposited particles to encourage the flocculation. The mixture is thus caused to pass through curtains of falling floc and between sedimentation trays to deposit the particles. The unit produces gravity flow serially and at predetermined individual velocities through the successive stages of the process, optimizing its flocculation and deposition conditions. (Prague-FIRL)
W75-11441

**SEWAGE TREATMENT WITH HYDROGEN PEROXIDE.**
Australian Patent 458, 666. Issued March 6, 1975. Official Journal of Patents, Trade Marks, and Designs, Vol 45, No 7, p 680-681, March, 1975.

Descriptors: *Waste water treatment, *Sewage treatment, *Odors, *Patents, Hydrogen sulfide, *Corrosion control, Sulfides.
Identifiers: *Hydrogen peroxide.

A process for treating sewage and sewage system to remove odors caused by hydrogen sulfide and to reduce corrosion caused by oxides of sulfur has been patented. It involves using hydrogen peroxide to oxidize sulfide and hydrogen sulfide and control their regeneration or recurrence. The preconditioning treatment is to introduce hydrogen peroxide into the sewage in an amount 10 times the stoichiometric equivalent of sulfide and hydrogen sulfide in the influent sewage for a period of time sufficient to reduce the sulfide and hydrogen sulfide levels to essentially zero. The sulfide and hydrogen sulfide are then continuously maintained at essentially zero levels either by introducing hydrogen peroxide into the sewage in the absence of aeration in an amount 1-2 times the stoichiometric equivalent of sulfide and hydrogen sulfide into the sewage while aerating the system with air or oxygen enriched air or oxygen in an amount one-fourth to one times the stoichiometric equivalent of sulfide and hydrogen sulfide in the influent sewage. (Orr-FIRL)
W75-11443

**TREATING EFFLUENT.**
Australian Patent 459,333. Issued March 29, 1975. Official Journal of Patents, Trade Marks and Designs, Vol 45, No 9, p 951, March, 1975.

Descriptors: *Patents, *Sewage treatment, *Plastics, Filtration, *Waste water treatment, Effluents, Aeration.

A method was patented to treat whole raw sewage effluent. The effluent is mascerated, then passed into a vessel of submerged contact media. The media consists of a bed of randomly arranged pieces of plastic material. After the effluent is passed through the media, it is aerated. Treated effluent is then withdrawn from the vessel at a point above the bed. (Prague-FIRL)

**REGIONAL SEWERING AND GROUNDWATER QUALITY IN THE SOUTHERN SAN JOAQUIN VALLEY,**
K. D. Schmidt.
Water Resources Bulletin, Vol 11, No 3, p 515-525, June 1975. 4 fig, 9 ref.

Descriptors: *Groundwater movement, *Water pollution, *Water quality, *Seepage, *Sewage disposal, *California, Water reuse, Groundwater recharge, Sewage treatment, Chlorides, Chemical analysis.
Identifiers: *San Joaquin Valley(Calif), *Regional sewering, Fresno(Calif).

Sewage effluent is commonly disposed of on land in arid regions, and the majority usually recharges the groundwater. Few evaluations have been made on the effect of effluent disposal on groundwater quality in the west. Groundwater hydrologists are rarely involved with treatment plant design and operation or effluent disposal in the San Joaquin Valley, California. The effect of regional sewering programs on groundwater quality in this valley was evaluated. Research was conducted on past studies of sewage effluent disposal. An extensive water sampling program was undertaken near the Fresno Sewage Treatment Plant. Chloride contents were used to trace recharged effluent. The extent of recharged effluent was delineated and traced for about ten miles. Sampling between the plant and the urban Fresno area indicated a high probability of large-scale leakage of raw sewage to the groundwater. There was demonstrated a need for development of better, smaller sewage treatment plants and individual waste disposal systems. (Lardner-ISWS)

J. F. Gaudy, Jr.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-245 , $7.50 in paper copy, $2.25 in microfiche. Completion Report, June 1975. 236 p, 28 fig, 6 append. OWRT A-043-OKLA(1).

Descriptors: *Activated sludge, Temperature, Effluents, Flow rate, Hydrogen ion concentration, Water pollution effects, *Waste water treatment, Microbial degradation, Growth rate.
Identifiers: *Shock loading.

This project was undertaken to analyze experimental results dealing with the response of continuously cultured heterogeneous microbial populations, elg., activated sludge, to step changes in feed flow rate, feed concentration, pH and temperature. The response was characterized by determining preshock, transient stage and final 'steady state' conditions of effluent substrate and biomass concentration and biochemical composition of biomass. Both once-through and cell recycle systems were studied and effect of specific growth rate and mean hydraulic retention time on response were assessed. In general, an increased retention time, cell recycle and biomass concentration lessened the amount of substrate leakage during the transient stage, whereas, a decreased specific growth rate alleviated disruption of plant efficiency. An appendix consists of six papers on these types of shock loading.

K. J. Yost.
United States Patent 3,879,285. Issued April 22, 1975. Official Gazette of the United States Patent Office, Vol 933, No 4, p 1741, April, 1975. 1 fig.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, Aerobic conditions, Equipment, Aeration, *Aerobic treatment, Domestic wastes.
Identifiers: *Aerobic digestion.

An apparatus and method for the aerobic digestion of sewage have been patented. The apparatus consists of the following parts: an essentially cylindrical treatment tank; a sewage water inlet line; a water discharge line defining an outlet within the center portion of the treatment tank; an air space above the surface of the water; an air conduit; means for directing a flow of air against the surface of the water to be treated in a manner such that circulation of the sewage in a horizontal circular path is effected; an air discharge passage from the air space for removing the circulated air. The sewage is treated by introducing it into the tank, supplying the air to effect the circulation of the water thereby centrifugally moving the heavier more polluted water radially outward in the tank while diffusing air into the water, and then exhausting the air. (Orr-FIRL)

**SEWAGE TREATMENT DEVICE,**
International Telephone and Telegraph Corp., New York. (assignee).
A. J. Peirish, Jr., and T. M. Uyeda.
United States Patent 3,878,569. Issued April 22, 1975. Official Gazette of the United States Patent Office, Vol 933, No 4, p 1513, April, 1975. 1 fig.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, Equipment, Municipal wastes, Domestic wastes.
Identifiers: Maceration.

A device for the treatment of sewage has been patented. It contains the following parts: a housing including a generally cylindrical section and a forward sewage inlet end; a rotable shaft coaxially mounted within the cylindrical section; a sewage macerating and conveying means mounted on the rotable shaft; an impeller mounted on the shaft; a discharge outlet on the housing; a means for rotating the shaft to cause maceration of the sewage entering through the inlet end and also to convey sewage to the impeller and out through the discharge outlet. The macerating means is comprised of a tapered auger-like element with a point facing forward, and a pair of blades with spiral-shaped leading edges converging toward the point. (Orr-FIRL)

**DOMESTIC SEWAGE SYSTEM,**
N. D. Arnot, Jr.
United States Patent 3,879,290. Issued April 22, 1975. Official Gazette of the United States Patent Office, Vol 933, No 4, p 1743, April, 1975. 1 fig.

Descriptors: *Patents, *Waste water treatment, Equipment, *Sewage treatment, Domestic wastes, Sterilization, *Oxidation, Aeration.

A patented sewage system which is designed primarily for domestic use consists of the following parts: two tanks of a similar size; a third tank smaller than the first two; connections between the three tanks in flow series; inlet means for sewage to enter the first rank and then flow into the second and third tanks; means for continuously aerating the sewage in the first and second tanks; means for causing essentially complete oxidation of the contents of the third tank; and timer means for actuating the oxidizing means and discharge means according to a predetermined sequence. The time sequence is in response to the filling of the third tank, allowing sufficient time for the sterilization of the contents of the third tank. (Orr-FIRL)
W75-11509

**SEWAGE TREATMENT SYSTEM,**
V. J. Kovarik.
United States Patent 3,875,051. Issued April 1, 1975. Official Gazette of the United States Patent Office, Vol 933, No 1, p 337-338, April, 1975. 1 fig.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, Equipment, *Biodegradation, Treatment, Suspended solids, Domestic wastes, Sewage, Flow control, *Separation techniques.

This patented method for collecting and treating sewage consists of the following steps: collection of the sewage of several containers; storage and non-biodegradable sewage solids in each container; partial decomposition of biodegradable solids through diagenetic decomposition in each container to reduce them in size and alter their specific gravity; separation (in each container) of the liquid sewage containing suspended solids smaller than a predetermined size from floating settled, and other solids; accumulation and temporary storage of these liquids and suspended solids between predetermined levels in each container; and, pumping the stored liquids and solids from each container as the liquid reaches the predetermined upper level. The storage of each container is used to promote a more even flow rate from a plurality of containers through collection lines interconnecting each container and the central final treatment means. **SEWAGE DISPOSAL SYSTEM,**
Babcock and Wilcox Co., New York. (assignee).
E. P. Foster, R. J. Kelly, and W. L. Sage.
United States Patent 3,875, 357. Issued April 1, 1975. Official Gazette of the United States Patent Office, Vol 933, No 1, p 416, April, 1975. 1 fig.

Descriptors: *Patents, *Waste water treatment, *Sewage disposal, Incineration, Fuel, Waste disposal, Ultimate disposal, *Sewage treatment, Municipal wastes.
Identifiers: A sewage disposal system has been patented which includes a liquid fuel fired steam generator, steam generating tubes, a furnace, and a passageway with a gas flow in communication

with the furnace. The first step is to fire the liquid fuel within the furnace to maintain a high temperature combustion zone for the generation of steam through indirect heat exchange. The fuel input to the furnace is continuously monitored. When the fuel input exceeds a predetermined level, a pressurized liquid-solids sewage mixture is injected into the combustion zone. The sewage input mixture is steam atomized prior to being injected, continuously metered into the combustion zone, and regulated so as to maintain a sewage to fuel input ratio resulting in essentially complete vaporization and incineration of the sewage mixture. **SEWAGE AND GARBAGE DISPOSAL.**
Australian Patent 458,672. Issued March 6, 1975. Official Journal of Patents, Trade Marks and Designs, Vol 45, No 7, p 682, March 1975.

Descriptors: *Patents, *Sewage treatment, *Waste water treatment, *Waste disposal, Ultimate disposal, Incineration, Fuels, Oil, Oxidation, Domestic wastes, Oil wastes, *Sewage disposal.
Identifiers: Hydrocarbon fuels.

A process for the disposal of garbage, solid waste matter, sewage, or mixtures thereof has been patented. The ground garbage, ground solids waste matter and/or thickened and dewatered sewage is combined in a mixing zone with a fluidizing medium. The fluidizing medium can be a liquid hydrocarbon fuel, a liquid hydrocarbon fuel-particulate carbon slurry, a particulate carbon-water slurry, or a mixture of these. The resultant mixture is called the feed mixture and is introduced into the reaction zone of a free flow unpacked noncatalytic gas generator. The feed mixture is reacted by partial oxidation with a free-oxygen containing gas and stream under synthesis-gas producing conditions. The conditions comprise an autogenous temperature in the range of 1500 to 3000 F and a pressure in the range of one to 250 atmospheres. The result of the reaction is a hot gaseous effluent stream composed of hydrogen, carbon monoxide, carbon dioxide, water, and particulate carbon.

**DESALINATION OF WATER.**
For primary bibliographic entry see Field 3A.
W75-11515

**TREATING SEWAGE.**
Australian Patent 459,688. Issued April 10, 1975. Official Journal of Patents, Trade Marks and Designs, Vol 45, No 11, p 1161, April, 1975.

Descriptors: *Patents, *Sewage treatment, *Filtration, *Waste water treatment, Suspended solids, Equipment.

Water containing suspended solids from a sanitary system may be treated by a patented method. The steps comprise: aerating the water; delivering the water to a screen with a directional component across the screen surface and a directional component through the screen. This screen has openings which are large enough to pass the majority of suspended solids, and the screen can hold a coating of the solids on its upstream side, controlling the flow of water containing suspended solids. As a coating of suspended solids forms of the screen surface, water is continuously delivered, and solids are filtered from the water passing through the coating and the screen. The relationship between the directional components is thus controlled, maintaining the coating on the screen, while still delivering water through the screen. Water which has passed through the screen is then stored and recycled to the sanitary system. (Prague-FIRL)
W75-11516

**IRRADIATION PLANT FOR FLUID MATL PARTIC SEWAGE SLUDGE.**
Netherlands Patent 12845W/08. Issued March 7, 1975. Derwent Netherlands Patents Report, Vol W, No 12, p 3-4, April 29, 1975.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Sludge treatment, *Irradiation, *Treatment facilities

Irradation of fluid material, particularly sewage sludge, is described. Radioactive sources are contained in an irradiation chamber, through which the material flows. The container for a series of radiation sources has channels for the introduction and withdrawal of these sources which can be closed off and sealed against the fluid material. A common closure piece is provided for closing these channels and can be pressed down onto the radiation source container by a clamping retaining element. The closure piece insures that radiation sources can be exchanged in a much shorter time. Thus the danger that one or more channels is not completely sealed is considerably reduced. (Prague-FIRL)
W75-11517

**HORIZONTAL REACTOR FOR POLYMSN. SEWAGE OXIDATION ETC.,**
F. Moser.
French Patent 87495V/51. Issued January 31, 1975. Derwent French Patents Report, Vol W, No 12, p 2, April 29, 1975.

Descriptors: *Patents, *Sewage treatment, *Water purification, Oxidation, Equipment, *Waste water treatment.
Identifiers: Hydrocarbons, Horizontal reactor.

A horizontal reactor is used for several chemical reactions including sewage water purification, sulfur dioxide absorption, and hydrocarbon halogenation. Reactions are carried out efficiently in a long horizontal vessel through which the main reaction medium, introduced at the inlet, flows. Over the whole length of the installation, separate devices are provided, positioned centrally at the bottom of the reactor. Holes are spaced closer at the start and widen in pitch progressively towards the opposite end. A second fluid medium is introduced at the point in order to set up additional currents rotating on axes parallel to the flow of the first medium. (Prague-FIRL)
W75-11518

**DEVICE AND METHOD FOR CONDUCTING WASTE LIQUID FROM A RECEPTACLE TO A PNEUMATIC LIQUID DISPOSAL SYSTEM,**
S. E. A. Svanteson.
Canadian Patent 967,843. Issued May 20, 1975. Patent Office Record, Vol 103, No 20, p 30, May, 1975.

Descriptors: *Patents, *Equipment, *Waste water treatment, Conduits, Liquids, Waste disposal, *Sewage disposal.
Identifiers: Vacuum disposal.

Equipment is described which conveys liquid from a holding receptacle to a vacuum sewage disposal system. There the waste liquid is conducted through a transport conduit. The conduit provides a suitable admixture of atmospheric air to the waste liquid being conveyed at the inlet end of the transport conduit. This gives greater efficiency in the conveyance of the liquid. (Prague-FIRL)
W75-11519

**LIQUID TREATMENT APPARATUS HAVING COMBINED REACTION BASIN AND CLARIFIER,**
L. S. Love.
Canadian Patent 968,081. Issued May 20, 1975. Patent Office Record, Vol 103, No 20, p 20-81, May, 1975.

Descriptors: *Patents, *Waste water treatment, Equipment, Aeration, Sludge, Industrial wastes, Municipal wastes.
Identifiers: *Clarification.

A treatment apparatus is designed for aerating or mixing and clarifying liquids such as industrial and sanitary waste waters and for conducting chemical reactions. The aeration or mixing basin and the clarifier are formed as one integral unit separated by a baffle. The flow from the aeration basin into the clarifier is controlled by flow control plates. The bottom of the clarifier slopes toward the aeration basin bottom such that solids settling in the clarifier flow down the clarifier bottom towards the aeration basin. This flow causes solids to be picked up by circulation in the aeration basin and re-suspended. A sludge scraper is periodically drawn across the clarifier bottom to dislodge sludge adhering to the bottom. The clarifier surface is periodically skimmed by a skimmer to remove scum. (Orr-FIRL)
W75-11521

**SEWAGE DISPOSAL PROCESS,**
A. Brent, and C. F. Teichmann.
Canadian Patent 967,751. Issued May 20, 1975. Patent Office Record, Vol 103, No 20, p 10-11, May 1975.

Descriptors: *Patents, *Waste water treatment, *Sewage disposal, *Dewatering, Fuel, Oxidation, Sludge treatment, Water reuse.

A disposal method for sewage involves the conversion of the sewage into synthesis gas or fuel gas by dewatering municipal sanitary sewage and producing a thickened sludge. The thickened sludge is mixed with a fluid selected from a group composed of water, liquid hydrocarbon fuel, particulate carbon slurries in water or in a liquid hydrocarbon fuel which is produced subsequently in the process, and mixtures of these, to produce a feed mixture stream. The feed mixture is heated to a temperature between 212 and 600 F to vaporize volatile constituents in the feed mixture and to produce a feed dispersion stream. The feed dispersion stream is partially oxidized with an oxygen rich gas in an unpacked free-flow non-catalytic synthesis gas generator, at a temperature between 1500 and 3000 F and at a pressure between one and 250 atmospheres, to produce synthesis gas. The water separated from the sewage is purified and used for industrial purposes or converted into product steam by indirect heat exchange with the product gas. This method can also be used to dispose of garbage by mixing bits of garbage with the thickened sewage sludge and the fluid, forming a feed mixture which is converted into synthesis gas by partial oxidation reaction with an oxygen rich gas in the same type of gas generator. **METAL REMOVAL BY PHYSICAL AND CHEMICAL TREATMENT PROCESSES,**
National Environmental Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
T. Maruyama, S. A. Hannah, and J. M. Cohen.
Journal Water Pollution Control Federation, Vol 47, No 5, p 962-975, May, 1975. 13 fig, 11 tab, 31 ref.

Descriptors: *Heavy metals, *Coagulation, *Sedimentation, *Filtration, *Adsorption, *Separation techniques, Mercury, Zinc, Nickel, Copper, Manganese, Lead, Chromium, Barium, Arsenic, *Waste water treatment, *Trace elements.
Identifiers: Waste water pollution, *Physical-chemical processes, Carbon adsorption.

Physical-chemical processes consisting of coagulation, sedimentation, filtration, and carbon adsorption have been shown to be capable of re-

ng substantial quantities of toxic or otherwise un-
esirable metals from raw wastewater. No one
oagulation system gave the best removal for all
etal forms. Metals tested were: Mn, Ni, Zn, Cu,
d, Ba, Pb, Cr, As, Hg. The chemistry of the
etals and the coagulant systems is presented.
lthough they are not evaluated in this study,
uitable process modifications, such as a change
f pH or the addition of oxidizing agents, reducing
gents, and specific precipitants, should further
nhance removal of the metals. The use of supple-
entary coagulants as filtration aids would also be
xpected to increase removal of precipitated
etals. (Delfiner-Vanderbilt)

EN CUT METHOD USED FOR MAJOR
WER.
gineering and Contract Record, Vol 88, No 6, p
15, June, 1975. 2 fig.

criptors: *Sewers, *Waste water treatment,
neling, Construction equipment, Earth han-
g equipment, Pipelines.
ntifiers: Sanitary collector sewer, Open cut
struction method.

n cut methods are being used by the Beaver
derground Structures of Ottawa, Canada, to in-
2500 feet of a 5742 foot sanitary collector
er. As compared to conventional tunneling,
s of the open cut method will be considerably
er. This method is possible with the use of
e trenching equipment and sophisticated de-
ering techniques. One of the first Koehring
D hydraulic excavators, with a maximum
h at grade level of over 60 feet and a maximum
depth of 40 feet, was used for excavation; its
sized buckets have a capacity range from 5 1/2
2 5/8 cubic yards. Additionally, the project util-
the Fiat-Allis HD41, the largest existing bull-
r, which can push up to 28 cubic yards of
rial at one pass. Pipelaying, pipe alignment by
, and backfill are described. A deep well de-
ring system was chosen, comprising 13 per-
ent wells. A pump system pumped 7 mgd at its
. A 10-ft diameter tunnel has been excavated
g two sunken shafts, one supported with steel
t piping and ring beam whalers, the other with
auge liner plate. Whe completed in late 1975,
unnel will be concrete lined to a 7 foot 6 inche
ter using full circle steel forms. (Kramer-
L)

**MILE OF SEWER LINE RENEWED WITH PLASTIC PIPING.**
Roads and Streets, Vol 118, No 6, p 94, 96, June, 1975. 3 fig.

Descriptors: *Waste water treatment, *Sewerage, *Plastic pipes, Construction materials, Pipes, Piping systems, Costs, Sewage treatment, Texas.
Identifiers: Remote tapping, Sewer repair.

Problems of backups, seepage, and an overloaded system due to breakdowns of existing pipes from unstable soil conditions in Houston, Texas have been solved. Rather than a conventional system of pipe removal and replacement, a one-mile sewer line was lined with ultra high molecular weight high density polyethylene pipe. This type of plastic piping is strong, very flexible, completely watertight, and chemically inert. Seven excavations were made over an 80 work day period and no more than one block of streets was closed to residents at any time. Segments of 8-inch diameter pipe 120, 350, and 453 feet long were inserted into the deteriorating line. A 16-inch diameter line was pulled 1016 feet, and a 20-inch diameter line was pulled 2350 feet. A remote tapping technique was used to connect house laterals to the sewer mains. This was the first municipal application of the tapping system. It involved: swaging down the flared plastic pipe (used for the connection) at the work site by forcing it into a die, making its diameter smaller; inserting the swaged pipe into a hole in the sewer main to the depth of the shoulder of the swage; and allowing the swaged part of the polyethylene pipe to return to its original size for a pressure tight seal. (Kramer-FIRL)
W75-11619

**PIPE INSERTION RENEWS SEWERS WITH LITTLE EXCAVATION.**
Water and Sewage Works, Vol 122, No 6, p 56-57, June, 1975. 2 fig.

Descriptors: *Waste water treatment, *Sewerage, *Sewage treatment, *Piping systems, Pipes, Plastic pipes, Costs, Construction materials, Pipelines, Sewers, Texas, Outfall sewers.
Identifiers: Sewer repair.

The collapse of a major clay outfall line which led directly to the Wylie, Texas sewage treatment plant occurred in 1972. The black-clay soil in that area is extremely corrosive; also, soil expansion during wet seasons exerts crushing pressures on the system's clay sewer pipes. The cost of direct burial of ductile iron pipe as replacement was the prohibitive amount of $175,000, and the city of Wylie chose instead to insert a flexible, corrosion resistant polyethylene pipe into 3730 feet of their deteriorated sewer lines. This new method saved the city close to 80 percent of the cost of the burial method. 'Aldyl' D polyethylene pipe, 13 3/8-inch diameter was heat-fused so that continuous lengths of up to 600 feet were formed. Ten lengths of plastic piping were each pulled by a 5/8 inch steel cable, threaded through the sewer from a winch located at a pulling excavation to an access trench at the opposite end of the line. Sewer insertion renewal was completed without disruption of service to the community, and excavation time was greatly reduced as compared to conventional pipe replacement. (Kramer-FIRL)
W75-11620

**IMPROVEMENT OF COMBINED SEWER SYSTEM STORM WATER STORAGE POOL (GORYU-SHIKI GESUIDO NO KAIRYO, TAISUI IKE HOSHIKI),**
S. Matsubara.
Gesuido Kyokaishi, Vol 12, No 131, p 39-46, April, 1975. 9 fig, 5 tab, 6 ref.

Descriptors: *Combined sewers, *Rainfall, *Storm water, *Waste water treatment, Sewerage, Model studies, Rivers, Overflow.
Identifiers: Storage pools, Japan.

Combined sewer systems, in which excess water from rainfall is forced to flow to a municipal river may be improved. This simulation considers a hypothetical storage pool to reduce the discharge of sewer water into a river under rainfall conditions. Two cases were discussed, each considering the amount of rainfall, capacity of the sewer systems, input rate ofthe sewage water by an urban population, BOD value in the sewer system, storage pool capacity, and capacity of the pump which is used to flush back the water in the storage pool to the sewer system when rainfall has stopped. A calculation was made for the Atsugi drainage system in which excess sewer water is flowed to a nearby river when the input rate of sewer water exceeds 3.0 cu m/sec. When a 30,000 cu m storage pool was employed with a pump of 2.3 cu m/sec capacity, the calculated number of overflows of the sewer sytem was 4.2/year which is 15% of the present number; overflow water into the river was 5.9 ton/year or 33% of the present level, and the overflow time was 102 hr/year or 16% of its present level. If the capacity of the storage pool was 10,000 cu m with the 2.3 cu m/sec pump, the overflow is calculated to occur 10.3 times/year with an overflow amount of 11.3 ton/year and overflow time of 29.8 hr/year. As long as the pump capacity is kept at over 0.5 cu m/sec, the determining factor of sewer water overflow to the river is the capacity of the storage pool. (Katayama-FIRL)

**SUBSURFACE WASTE INJECTION IN THE UNITED STATES: FIFTEEN CASE HISTORIES,**
Bureau of Mines, Bartlesville, Okla. Bartlesville Energy Research Center.
E. C. Donaldson, R. D. Thomas, and K. N. Johnston.
For sale by the Superintendent of Documents, U.S. Government Printing Office, Washington, D.C. 20402, Price $1.15. Information Circular 8636, 1974. 72 p, 27 fig, 19 tab, 54 ref.

Descriptors: *Industrial wastes, *Waste disposal wells, *Injection wells, *United States, Injection, Waste disposal, Geologic formations, Geology, Subsurface waters, Waste storage, Underground waste disposal, Waste water treatment, Liquid wastes, Slurries, Fluid mechanics, Design criteria, Costs, Water pollution.

Subsurface injection of liquid and slurry-type industrial waste is being used as a means of waste disposal. This U.S. Bureau of Mines survey showed that the method can be economically and environmentally attrative if the proper precautions are taken, especially when the alternative is cursory treatment and discharge at the surface. Attention was called to petroleum technology and experience that can be applied to subsurface waste injection. The report included discussions of: (1) the general aspects of subsurface waste-injection systems; (2) the literature concerning the geologic formations available for injection in the United States; and (3) 15 case histories describing the source and nature of the waste and the geology, surface equipment, well completion, and operation of the systems. (Robinson-ISWS)

**PROVIDING SUBURBAN SEWERAGE DESPITE ENVIRONMENTAL AND CONSTRUCTION PROBLEMS,**
Minnetonka Public Works, Minn.
D. Asmus, and J. Orr.
Public Works, Vol 106, No 7, p 76-77, July 1975. 3 fig.

Descriptors: *Sewerage, *Construction costs, *Construction equipment, Environmental effects, Dewatering, *Waste water treatment, Sewage treatment.
Identifiers: Sanitary sewers, Gravity sewers.

An internal trunk sanitary sewerage collection system was planned and constructed by the suburban community of Minnetonka, Minnesota. The system has been designed for a population equivalent of 160,000; projected costs were 15 million dollars with financing largely through the sale of general obligation improvement bonds. Construction was carried out by a series of thirty-one separate trunk sewer contracts. One environmental problem in construction was the building of an 18-inch gravity sewer out across Wing Lake in order to avoid damaging trees in the adjacent wooded land. To facilitate construction, over 17,000,000 gallons of water were pumped from the lake and it was afterward refilled from the municipal water system. Other problems included placing of sewers on treated wood piling in unstable soils such as the glacial moraine marsh areas, and the frequent drying up of private wells due to construction dewatering. The first problem was solved by longitudinal pile spacing of eight to twelve feet; the second was solved when residents with dried-up wells were supplied with a temporary water source and wells were found in most cases to be usable after dewatering operations were stopped. (Kramer-FIRL)
W75-11657

**SEWAGE BIOLOGICAL PROCESSING,**
S. Matskrle, and V. Matskrle.
Soviet Patent 415862. Issued May 20, 1975. Derwent Soviet Patents Report, Vol W, No 15, p 7, May 1975.

Descriptors: *Patents, *Biological treatment, *Sewage treatment, Flocculation, Separation techniques, Filtration, Activated sludge, *Waste water treatment, Coagulation, Flotation, Recycling, Water reuse.

A biological sewage treatment process was patented which operates by the formation of bioflocs, followed by filtration separation, flotation, and recirculation. The suspension is subjected to sedimentation, and the dilute suspension flows back, returning to the process. In this example, 5 to 7 kg/cu m of activated sludge was used with sewage in the activation chambers, with a residence time of two to three hours being sufficient for purification. The separation rate was up to one mm/sec; oxidation activity was 18.5 g 02 from one cu m of air. The chamber used was divided into two similar chambers to allow the flocs to float freely and to grow. Dilute suspension flowed directly to the filters for separation and the flocs floated to a homogenizer where coagulant could be added to the suspension. (Kramer-FIRL)
W75-11658

**WASTE WATER AND SEWAGE PURIFICATION.**
French Patent 22898W/14. Issued February 21, 1975. Derwent French Patents Report, Vol W, No 14, p 3, May 1975.

Descriptors: *Patents, *Waste water treatment, *Biological treatment, Sludge treatment, Oxygen, Activated sludge, Tanks, Treatment facilities.

A plant patented for waste water and sewage purification is described. The facility uses pure oxygen or air enriched with oxygen in the presence of activated sludge. A biological tank contains bacterial beds which are in the form of discs one cm thick, spaced 2.5 cm apart. A quantity of 1.5 to 2.0 kg of sludge per cu m of the tank may be maintained on the discs; of this, one kg or more is living matter. The tank is connected by an overflow to a clarifier from which the purified water overflows while sludge collects at the bottom. Water to be treated as well as some of the sludge from the base of the clarifier arrive at the inlet together. Oxygen is introduced and the oxygenated water passes into the biological tank, meeting activated sludge. Aeration takes place outside the biological tank, with a low circulation rate and a reduction in the energy requirements. (Kramer-FIRL)
W75-11659

**BIOLOGICAL AND CHEMICAL PURIFICATION PLANT.**
Belgian Patent 22554W/14. Issued March 3, 1975. Derwent Belgian Patents Report, Vol W, No 14, p 3, May 1975.

Descriptors: *Patents, *Biological treatment, *Waste water treatment, *Water treatment, Costs, Equipment, *Treatment facilities.
Identifiers: Chemical treatment, Modular units.

A biological and chemical water purification plant for use in populated areas was issued a patent. The plant is constructed from uniform modular units which reduce manufacturing costs and allow for the assembly of different types of purification plants. Biological purification equipment consists of three recipients with cylindrical envelopes which are open at the top and have conical shoulders arranged tangentially. The space between two recipients, formed by an inclined wall, forms a separation space to separate the suspended flocculates from the purified water. A partition forms a gas separation space in which the gas is removed from the purified water before its entry into the separation space. Aerators in the activation space are provided and are immersed to a shallow depth. Raw water enters at the center of this space and clarified water leaves via collecting pipes in the upper portion of the plant. Sludge is withdrawn through aeration grids which make the operation economical and lower the energy consumption. (Kramer-FIRL)
W75-11660

**DOMESTIC WASTE WATER AND SEWAGE EVACUATION DEVICE.**
French Patent 29528W/18. Issued March 21, 1975. Derwent French Patents Report, Vol W, No 18, p 5, June 1975.

Descriptors: *Waste water treatment, *Patents, Domestic wastes, Sewage treatment, Sewers, Pumps, Tanks, Domestic water, Costs, Equipment.
Identifiers: Evacuation.

An evacuation device for domestic waste water and sewage was patented, for use when the lowest point of an installation is below the level of the sewer or the septic tank. The equipment consists of a welded metal tank, which acts as a reservoir and a turbine pump driven by an electric motor with a vertical shaft. Waste water entering at the top of the tank is pumped out through a pipe; this water reaches the pump by an opening. Volute, surrounding the pump turbine, is kept filled so that the pump is continually primed and there are no starting problems. The tank and its connections all are welded and simply constructed; costs are therefore low and space requirements minimal. (Kramer-FIRL)
W75-11661

**SOLIDIFICATION OF SEWAGE SLUDGE TO A HARD MATERIAL.**
Belgian Patent 29090W/18. Issued April 1, 1975. Derwent Belgian Patents Report, Vol W, No 18, p 2, June 1975.

Descriptors: *Patents, *Sewage treatment, Drying, *Sewage sludge, Coagulation, *Waste water treatment.
Identifiers: Aluminosilicates, Sludge solidifying, Waste reuse.

A patent was granted for a method of solidifying sewage sludge into a hardened solid material. This may be accomplished with or without prior coagulation and decantation by incorporation of aluminosilicates on a dry weight basis. For example, fly ash (preferably 30 to 80%), lime (preferably 1 to 6%), earth (preferably 20-45%), and CaSO4, usually as anhydrite (preferably 1.5 to 3.0%) are utilized. The final water content is optimally 15 to 30% and the final dry weight of solid sludge varies from one to 50%, preferably 4 to 20%. The fly ash may be replaced by crushed furnace slag. CaSO4 may be replaced by an equimolar amount of alkaline earth metal sulphate and cement dust, quicklime or dust from a basic oxygen furnace may substitute for the lime. Hardening in the atmosphere gives a granular or monolithic solid, which can be used as a building material. The product offers good resistance to compression, humidity, and leaching. (Kramer-FIRL)

**WASTE WATER PURIFICATION.**
South African Patent 30562W/18. Issued February 5, 1975. Derwent South African Patents Report, Vol W, No 18, p 3, June 1975.

Descriptors: *Patents, *Waste water treatment, *Sludge treatment, Oxidation, Potable water, Separation techniques, Water reuse, Coagulation, Acidity, *Water reuse.
Identifiers: *Wet air oxidation, Aluminum compounds, Waste reuse.

A patent was granted whereby waste water is purified and the oxidized sludge may be reused for further waste treatment. This potable water clarification or waste water purification process consists of coagulation-separation, using coagulants of aluminum compounds. Wet air oxidation treatment of the sludge results from the coagulation-separation process. The pH of the sludge should be adjusted in advance so that an oxidized sludge of pH below 1.5 or above 9.0 can be obtained. The oxidized sludge may be reused for water treatment either directly or after the dissolving of the aluminum compounds by the addition of acid or alkali. (Kramer-FIRL)

**ADVANCED TREATMENT OF WASTE WATE AFTER SECOND STAGE TREATMENT. E PERIMENTAL RESULTS AT THE WATE TREATMENT PLANT OF KAWASAKI CIT (GESUI NIJI SHORISUI NO KODO SHOR KAWASAKI-SHI GESUI SHORIJO NI OKER JIKKEN HOKOKU).**
Mizushori Gijutsu (Water Purification and Liqu Waste Treatment), Vol 16, No 4, p 365, 1975. fig, 17 tab.

Descriptors: *Waste water treatment, *Water p rification, *Tertiary treatment, *Water reu Coagulation, Filtration, Activated carbon, A sorption, Electrodialysis, Reverse osmosis, Wa treatment, Treatment facilities.

The advanced purification of secondary trea waste water for reuse as industrial water was s died. Waste water treated by a conventio sewage plant is used as the raw water, and i treated by coagulation with inorganic and orga reagents, followed by filtration, activated car adsorption, and electrodialysis or reverse osmo The raw water with 10 ppm turbidity may be proved to 2 ppm turbidity with the addition o ppm inorganic and one ppm organic coagula agents. The 75% to 95% of COD, TOC, and A were removed by an activated carbon, but ads tion of ammonia, heavy metals, and phosph were difficult by the activated carbon. More 90% removal of sodium, potassium, chlo sulfate ions was achieved with 150 mi deionization by an electrodialysis technique, water with the dielectric constant less than microohm/cm could be obtained. However soluble salts and organic compounds were removed by this method. The osmosis techn was also applicable to the purification of water, and purified water of industrial quality be continuously produced for several hur hours. (Katayama-FIRL)

**COAGULANT RECOVERY TAKES PLANNING,**
C. G. Dunkle.
Water and Wastes Engineering, Vol 12, No 5, p 47-48, 104, May 1975.

Descriptors: *Waste water treatment, *Sludge treatment, Lime, Recycling, *Coagulation, Economics, Costs, Dewatering, Waste disposal, Polymers, Polyelectrolytes.
Identifiers: *Coagulants, *Alum, Recovery, Magnesium carbonate.

The recovery of coagulants from the waste sludge of water treatment plants demands the prior study of each specific coagulant and related methods of clarification. Several treatment facilities are discussed. For example, the recovery of alum at Tampa, Florida for reuse in the filtration plant gave odorless waste solids which could be stored before final disposal. Similarly, reclamation of lime and CO2 from chemical treatment plants at Dayton, Ohio, and St. Paul, Minnesota, lessened the final disposal problem and reduced the facilities' operational costs. In Montgomery, Alabama, lime and MgCO3 were recovered; the magnesium carbonate is recycled to remove color and turbidity from raw water. Applicability of polymers as primary coagulants, coagulant aids, and sludge conditioning agents are being investigated. Polymers are expensive but more efficient than alum. However, there is no universal polymer, and careful choice of specific polyelectrolyte is necessary for individual applications. The efficiency and economy of sludge production and handling indicated that a combination of alum recovery and horizontal vacuum filtration would require a large capital and operating costs but would produce a useful end product, decrease the size of dewatering equipment needed, and reduce landfill requirements. (Kramer-FIRL)

**THE APPLICATION OF MEMBRANE PROCESSES IN THE TREATMENT OF SEWAGE,**
Atomic Energy Research Establishment, Harwell (England).
D. C. Sammon, and B. Stringer.
Process Biochemistry, Vol 10, No 2, p 4-12, March 1975. 2 fig, 11 tab, 56 ref.

Descriptors: *Membrane processes, *Reverse osmosis, *Waste water treatment, Water quality, Activated sludge, Costs, *Sewage treatment.
Identifiers: Ultrafiltration, Electrodialysis, Effluent reuse, Salt removal.

The membrane processes of reverse osmosis, ultrafiltration, and electrodialysis, now established for water treatment, are under evaluation for use in sewage effluent treatment. With an increasing reuse of sewage effluents, possible applications of membrane processes are in the reduction of salt content and of several organic species. Findings of published experimental work were reviewed. The major areas of investigation were: stability of flux and the mechanism of flux loss due to fouling; product quality with respect to a range of species; treatment of sludges; and economics and possible applications. It was concluded that direct reuse of sewage effluent for potable water has not yet received public acceptance. Costs of reverse osmosis rather than conventional treatment for water reuse at a less than potable quality level indicate that osmosis is not economically feasible. The state of the art currently is that pilot scale work has identified problem areas and indicated operational techniques. Except for the use of activated sludge treatment, coupled with ultrafiltration, membrane process applications for waste water treatment remain theoretical. (Kramer-FIRL)

**SEWAGE TREATMENT PLANT EQUIPPED WITH AN AERATION IMPELLER,**
R. Kaelin.
Canadian Patent 968,475. Issued May 27, 1975. Patent Office Record, Vol 103, No 21, p 81, May 1975.

Descriptors: *Patents, *Waste water treatment, Treatment facilities, *Sewage treatment, Equipment, *Aeration, Design.
Identifiers: *Aerators.

A patent has been issued for a sewage treatment plant which is equipped with a motor driven aerator. The aerator is supported in a basin at a minimum of three points. The support mechanism for the aerator embodies at least two supports which at their ends nearest to the aerator enclose an acute angle with a horizontal plane less than 45 degrees. (Orr-FIRL)

**MEANS FOR AND METHOD OF PURIFYING CONTAMINATED WATER,**
R. J. Campbell.
United States Patent 3,885,399. Issued May 27, 1975. Official Gazette of the United States Patent Office, Vol 934, No 4, p 1379, May, 1975. 1 fig.

Descriptors: *Patents, *Waste water treatment, *Water treatment, Equipment, Freezing, *Crystallization.
Identifiers: *Freeze-crystallization.

A method for purifying contaminated water by freeze-crystallization has been patented. The apparatus consists of: a first stage including a first freezer-crystallizer and wash collumn subassembly for treating contaminated water and producing a first concentrate; a second freezer-crystallizer and wash column subassembly for treating the first concentrate and producing pure ice crystals and a second concentrate; and, means for returning part of a mixture of ice crystals and first concentrate from the second wash column to the first stage. The second freezer-crystallizer is coupled to the first wash column to receive the first concentrate and also to the second wash column to receive the second concentrate. The second wash column is coupled to the first wash column for receiving and using the first concentrate to wash the ice crystals in the second wash column and to form a mixture of the first concentrate and the ice crystals. **PURIFYING PLANT FOR SEWAGE,**
J. Bosje.
Canadian Patent 967,295. Issued May 6, 1975. Patent Office Record, Vol 103, No 18, p 75, May, 1975.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Activated sludge, Biological treatment, Aeration, Sludge treatment, Treatment facilities.

An activated sludge process sewage treatment plant has been patented. The plant includes an open curved tank with an elongated aerating space shaped so that its end walls are located adjacent to each other. The aerating space is divided by a partition wall which forms an inner channel portion enclosed within an outer channel portion. The channels are in series with each other, forming an endless aerating channel. Means are provided to discharge sewage into the aerating channel and to withdraw aerated sewage from the channel. A minimum of one surface aerator is provided for aerating the contents of the aerating channel. At least one sludge thickening chamber is concentrically arranged in the sludge settling chamber which is located in the inner channel portion of the aerating channel. Means are provided for returning settled sludge from the settling chamber to the aerating space, and for discharging the purified water out of the sludge settling chamber. The end walls of the aerating channel are separated to provide space for the apparatus for operating the plant and for a control chamber. (Orr-FIRL)

**CENTRIFUGAL PUMP FOR PROCESSING LIQUIDS CONTAINING ABRASIVE CONSTITUTENTS, MORE PARTICULARLY, A SAND PUMP OF A WASTEWATER PUMPER,**
Neratoom N.V., The Hague (Netherlands). (assignee).
J. H. Bunjes.
United States Patent 3,881,840. Issued May 6, 1975. Official Gazette of the United States Patent Office, Vol 934, No 1, p 227-228, May, 1975. 1 fig.

Descriptors: *Patents, *Pumps, *Centrifugation, *Waste water treatment, Equipment.

A centrifugal pump for waste water treatment was patented, consisting of: a housing with an inlet opening and an annular delivery chamber; an impeller whose inlet eye is aligned to the inlet opening and whose peripheral portion discharges to the delivery chamber. The impeller and the housing thus define an intermediate chamber leading to the delivery chamber. Also, sealing means are formed between the openings, including opposed surface portions of the impeller. These define a sealing slot which has an outer end communicating with the intermediate chamber and an inner end connected to the inlet opening. Duct means in the impeller lead from an annular chamber to the intermediate chamber in order to redirect sediment back into the intermediate chamber. (Kramer-FIRL)

**AIR DRIVEN ROTATING BIOLOGICAL CONTACTOR APPARATUS,**
Autotrol Corp., Milwaukee, Wis. (assignee).
D. G. Prosser.
United States Patent 3,886,074. Issued May 27, 1975. Official Gazette of the United States Patent Office, Vol 934, No 4, p 1594-1595, May, 1975. 1 fig.

Descriptors: *Waste water treatment, *Patents, *Biological treatment, *Aeration, Equipment, Oxygen.
Identifiers: Biological contactor apparatus.

The equipment for biological treatment of waste water by an air driven rotating biological contactor was patented. The apparatus consists of a treatment tank with both a fluid inlet and a fluid outlet, a circular rotating biological contactor assembly which is mounted for rotation around a horizontal axis and which can be partially submerged in the waste water in its tank. Several pockets are built along the length of the contactor and have a depth of the minor portion of the radius of the contactor assembly. A source of oxygen which contains gas under pressure and a gas conduit leading from this source into the tank are described. The conduit has submerged openings beneath the length of the contactor. Each pocket opens outwardly in a direction opposite to the direction of rotation of the assembly in order to trap gas released from the conduit. (Kramer-FIRL)

**OXYGENATION OF WASTE WATER,**
P. W. Garbo.
Canadian Patent 970,483. Issued July 1, 1975. Patent Office Record, Vol 103, No 26, p 82-83, July, 1975.

Descriptors: *Patents, *Waste water treatment, *Sewage treatment, *Oxygenation, Suspended solids.

Sewage or other waste water may be oxygenated using a patented process. The waste water is passed through a turbulent mass of solid contact particles, together with oxygen-containing gas. Pollutant solids collide with these contract particles which may be made of coarse sand, and a fine dispersion of the oxygenating gas results throughout the liquid suspension. The contact of the dispersion of gas with the suspended and dissolved solids of the sewage or waste water causes an acceleration in the oxygenation process. (Kramer-FIRL)
W75-11681

**BIOLOGICAL PURIFICATION OF WASTE WATER.**
Australian Patent 461,079. Issued May 15, 1975. Official Journal of Patents, Trade Marks and Designs, Vol 45, No 16, p 1791, May, 1975.

Descriptors: *Patents, *Biological treatment, *Waste water treatment, *Activated sludge, Aeration, Settling basins.
Identifiers: Clarification.

A patent was issued for a method of biological waste water treatment. Activated sludge treatment is used in equipment consisting of common enclosure aeration and settling-clarification sections. The system is designed so that the two sections communicate with each other and aerated liquid may flow from the aeration section to the aeration section. Aerated liquid is directed to the bottom of a set of parallel inclined plates which cover almost the entire settling surface area of the settling-clarification section. (Kramer-FIRL)

**SEWAGE TREATMENT PROCESS,**
G. V. Levin, and G. J. Topol.
Canadian Patent 970,887. Issued July 8, 1975. Patent Office Record, Vol 103, No 27, p 84, July, 1975.

Descriptors: *Patents, *Activated sludge, *Waste water treatment, *Sewage treatment, Nutrient removal, Biological treatment, Phosphates, Sludge treatment, Anaerobic conditions.

An activated sludge treatment process was patented, consisting of mixing influent sewage material with activated sludge to provide a mixed liquor. This mixed liquor is passed first to an aeration zone, where BOD is reduced and microorganisms present take up phosphate, and then to a settling zone, containing an anaerobic sludge layer. In the settling zone, the phosphate-enriched sludge settles into the anaerobic sludge layer, so that a substantially phosphate-free effluent is removed from above the sludge layer. Sludge must be maintained under the anaerobic conditions long enough for the organisms in the sludge to release phosphate to the liquid phase of the sludge. Sludge is then treated to remove the soluble phosphate from its liquid phase and is then recycled for mixing with influent sewage material. (Kramer-FIRL)

**OUTLINE OF TAGAWA SEWAGE PLANT IN UTSUNOMIYA CITY, (IN JAPANESE),**
I. Koike, and N. Saito.
Gesuido Kyokaishi, (Jour of Japan Sewage Works Assoc), Vol 12, No 129, p 72-76, February, 1975. 1 fig, 3 tab.

Descriptors: *Waste water treatment, *Sewage treatment, Facilities, Municipal wastes, Sludge treatment, Precipitation(Chemical), Aeration, Chlorine, Dehydration, Incineration, *Treatment facilities.
Identifiers: *Japan.

Since 1965, the Tagawa plant in Utsunomiya city Japan, has been treating its municipal sewage water. With an added capacity of its facility in 1970, the plant now treats waste water for a population of 125,000. The sewage water is passed through several screens to remove large objects before entering a sand-precipitation pool. It is then pumped into a first-precipitation pool and stays for 1 3/4 hours in the pool. The supernatant water then enters into an aeration tank, a final-precipitation pool, and a chloride mixing pool, before being discharged into the Tagawa River. During wet weather, the aeration and final-precipitation steps are skipped, and the supernatant water is sent directly to the chloride mixing pool. Sludges produced during precipitation and aeration treatment are sent to a sludge concentration tank. After dehydration of the treated sludges, they are sent to an incinceration furnace and combusted at 800 to 1000C. (Katayama-FIRL)

**PACKAGE PLANT OWNER RESPONSIBILITY AND OPERATION OF SMALL SEWAGE UNITS,**
N. P. Nicolle.
Water Pollution Control, Vol 74, No 2, p 199-200, 1975.

Descriptors: *Waste water treatment, *Sewage treatment, *Maintenance, Aeration, Biological treatment, Filters, Sewage effluents, *Operations, *Treatment facilities.
Identifiers: *Package plant sewage units, Effluent control.

The necessary care and maintenance of package plant small sewage units is described. The major required daily duty is removal of gross solids to prevent sewage from backing up or overflowing, particularly in the openings of valves and pumps. Package plants of the conventional biological filtration type and extended-aeration units with aerobic digestion are the two basic types of package plants available for small communities. Quality control for the conventional unit requires the daily determination of settleable solids in primary sedimentation tank effluent as well as from humus tanks or sand filters and determination of residual chlorine which may be present in effluent entering the contact tank. On a monthly or three-monthly basis, values should be measured of: 4-hour permanganate value; COD, ammonia nitrogen, suspended solids, fecal E. coli, and methylene blue stability. For the extended aeration units, daily determination must be made of settleable solids in effluent, MLSS concentration by centrifuge, and residual chlorine in the final effluent. The final effluent should be checked monthly for SS, 4-hour permanganate value, COD, ammonia nitrogen, fecal E. coli, and methylene blue stability. For both types of packages, cleaning is necessary of filters, screens, pipes, drying beds tanks and other surfaces. Other specific maintenance recommendations are given, in order to keep the unit at peak performance. (Prague-FIRL)

**PACKAGE PLANTS: THE CONTRACTOR'S POINT OF VIEW,**
E. L. Chontz.
Water Pollution Control, Vol 74, No 2, p 201-20
1975.

Descriptors: *Sewage treatment, *Administratio
Waste water treatment, Equipment, Design, E
fluents, Population, *Waste treatment.
Identifiers: *Sewage treatment package plants.

Package type sewage plants are discussed from t
point of view of the contractor. Advantages to t
contractor of such plants are that a discrete ran
of standard products can be offered, eliminati
design, administrative, and after sales cost
overall plant responsibility minimizes possib
controversy over process malfunction or failur
and plant complexity is reduced, plant compa
ness increased, and costs decreased without
fecting plant performance. The disadvantages
package plants for the contractor include: a lack
flexibility in choice of size range; absence
adaptability; and difficulty for a prospective clie
to assess and judge the variety of types
packages offered by different contractors. Whe
client approaches a contractor directly, he spe
fies a contributing population or a total daily flo
he also may specify the particular type of tre
ment to be employed. However, the plant desi
size of equipment, and guarantee of performan
and quality is up to the contractor. Package pla
should not be specified where extreme variatio
in population (such as a temporary camping s
occur. It is expected that package sewage tre
ment plants will increase in use. Control and re
lation of effluent discharges necessitates enlarg
their field of application. Non-biological treatm
processes in package plants are needed as
plants which will operate at peak efficiency
gardless of the volume and load of the influ
(Prague-FIRL)

treatment, *Anaerobic digestion, *Temperat
Heat, Energy, Costs, Organic loading, Dew
ing, California.
Identifiers: *Thermophilic digestion.

The Hyperion Treatment Plant, Playa del
California, used full-scale thermophilic dige
(thermophilic temperatures, 46-54.5C) from
to 1957. Thermophilic digestion is again bein
stituted at the plant in an attempt to achieve
removal of digested-screened solids prior to
disposal of the treated waste water. In additi
confirming earlier conclusions about thermo
anaerobic digestion, the dewaterability of the
philic sludge through the use of various typ
chemical conditioning and dewatering appara
being examined. Thermophilic anaerobic dige

f waste water solids has been shown to be a suc-
essful process. Temperature change has been
ound to be more critical than with mesophilic
gestion. The solids dewatering step is signifi-
antly improved by the thermophilic digestion.
he solids particle sizes are larger, lower amounts
chemicals are needed, drier cakes are obtained,
d centrate-filtrates carry substantially fewer
lids. The work at the Hyperion plant is still in-
mplete; the upper limits of loading are not yet
tablished. At the currently possible temperature
d loadings, the changes in gas production and
lids breakdown do not overcome the added en-
ronmental and monetary costs of the extra heat
ergy needed if the change in sludge dewatering
ignored. The net benefit of thermophilic
gestion seems to be greater than the costs result-
g from the increased heat requirement. (Orr-
RL)

er treatment, *Phosphorous, *Nutrient
oval, Biochemical oxygen demand, Chemical
gen demand, Suspended solids, Hydraulic
gn.
tifiers: Sweden, Lamella sedimentation.

den has more than 500 plants that are designed
the chemical treatment of sewage with or
out biological treatment and more than 600
ts that use biological treatment alone. Chemi-
treatment is gaining in favor because of the
rictions of phosphorus content and BOD of the
harged effluent and also because the long win-
in the northern part of Sweden make biologi-
treatment unsatisfactory. The methods used
chemical treatment are direct (primary and
ndary), simultaneous, and pre- and post-
ipitation. Post-precipitation is used in 80-85%
e chemical treatment plants. Alum is used in 85-90% of the plants. Lime and bivalent or trivalent iron salts are also used. 'Guidelines for Design of Sewage Treatment Plants' has been prepared by the Swedish National Environment Protection Board. Sections for coarse treatment and primary sedimentation should be designed to handle more than four times the hydraulic flow. Biological and chemical treatment processes should be able to handle up to two times the hydraulic flow. Lamella sedimentation has been successfully used for the separation of chemical flocs, but does not work well for separating biological flocs. The results of a survey of more than 50 municipal treatment plants for chemical precipitation conducted from 1971 to July 1973, indicate that the majority of the plants operate relatively well. The use of chemical precipitation for treating many different types of waste water in Sweden is expanding because of the fact that chemical precipitation will reduce the BOD, COD, and suspended solids of the discharged water in addition to removing phosphorus. **UP-RATING HYDRAULICALLY OVER-LOADED SEDIMENTATION TANKS BY INCLINED PLATES,**
T. W. Gray, and P. S. Churchill.
Effluent and Water Treatment Journal, Vol 15, No 2, p 77-81, February, 1975. 2 fig, 4 tab, 9 ref.

Descriptors: *Sedimentation, *Waste water treatment, Treatment facilities, *Settling basins, Sedimentation rates, Suspended solids.
Identifiers: *Sedimentation tanks.

High-rate sedimentation, by means of submerged inclined compartments, is becoming an established way to improve an existing overloaded municipal sewage treatment plant without expanding the facilities. CJB Developments is ofering two high-rate sedimentation processes using inclined corrugated plates to assist in this upgrading. The first process is the uprating of existing sedimentation tanks using low-cost high-rate sedimentation modules of plastic construction. The second process is a purpose-built, fabricated, high-rate sedimentation tank. The second process requires less land than a conventional tank and lowers the risk of developing anaerobic conditions. Conventional sedimentation tanks can be either horizontal-flow or upward-flow type. Both types can be successfully uprated for solids settlement using high-rate sedimentation modules. There is very little surface attraction to the plates in the CJBD module of the type of solids found in primary or humus tanks. The supernatant liquid flows in a clear stream up the arch-forming corrugation on the corrugated plate while the solids form a counter-current flow down the troughs. Washing down has not been necessary on a pilot unit which has been in operation for two years in a humus tank. (Orr-FIRL)

**ENERGY-WASTEWATER TREATMENT AND SOLIDS DISPOSAL,**
Playa Del Rey, Calif. Hyperion Treatment Plant.
W. F. Garber, G. T. Ohara, and S. K. Raksit.
Journal of the Environmental Engineering Division, Proceedings of ASCE, Vol 101, No EE3, p 319-332, June, 1975. 5 fig, 4 tab, 21 ref.

Descriptors: *Waste water treatment, *Treatment facilities, *Environmental effects, *Energy, Biological treatment, Sludge disposal, Landfills, Bodies of water, Dewatering, Nitrification, Oceans, California, *Waste disposal.
Identifiers: Los Angeles(Calif), Santa Monica Basin(Calif), Chemico-physical treatment, Anoxic-anaerobic deep water.

Effluent discharge standards and funding criteria established by control agencies as a result of the concern about environmental quality have affected the design and construction of waste water treatment facilities and waste water solids disposal systems. The increased energy needed for advanced treatment methods may actually increase the overall pollution. Work at the Environmental Protection Agency's Cincinnati Laboratories has shown that an activated sludge process for complete nitrification uses almost twice as much energy as treatment for carbonaceous oxygen demand removal alone. The amount of fossil fuel combustion to produce this energy would undoubtedly cause an increase in negative environmental impact. The State of California Water Resources Control Board has notified the City of Los Angeles that it must cease discharging digested-screened waste water solids into the anoxic-anaerobic deep waters and sediments of the Santa Monica Basin by the end of 1976. The City of Los Angeles has operated both chemico-physical and biological waste water treatment facilities. They have found that the chemico-physical treatment requires almost five the amount of energy as biological treatment. Alternatives to disposal in the ocean are: pumping to evaporation ponds with disposal on sanitary landfills requiring 16 times the energy than ocean disposal; and, mechanical dewatering prior to sanitary landfill disposal requiring 35 times more energy than the prior to sanitary landfill disposal requiring 35 times more energy than the present method. (Dean-FIRL)

**IN-LINE FILTRATION MAY BE JUST FOR YOU,**
Nalco Chemical Co., Chicago, Ill.
G. J. Venema.
Water and Wastes Engineering, Vol 12, No 5, p 50-52, 57, May, 1975. 1 fig.

Descriptors: *Filtration, *Waste water treatment, Water quality, Filters, Coagulation, Polymers, Mass transfer, Solid wastes.
Identifiers: Filter media, Solids, Polycationics, Physico-chemical treatment.

In the past, filtration technology was concerned with rapid sand and high rate filters. Current research in filtration technology is directed at the definition of the parameters for deep-bed filtration, upflow filtration, direct filtration, and in-line filtration. In-line filtration is an alternative to coagulation/settling for treating low turbidity water. Treatment requirements for water quality goals are the primary concern of direct and in-line filtration. Increasing the allowable flow rate through a media is the concern of rapid sand, deep-bed, and upflow filtration. Therefore, direct and in-line filtration treatment methods can be applied to rapid sand, high rate, deep-bed, and upflow filters. In direct filtration, coagulation of solids occurs prior to filtration. Coagulation occurs during filtration in the in-line filtration method. In-line and direct filtration depend on the theories of mass-transfer of solids from the liquid to the media surfaces and physico-chemical attachment of solids to the media. The advantages of these methods are a reduction of chemical consumption, a lower sludge production, longer filter runs, and improved water quality. The performance of in-line and direct filtration depend on the type and amount of solids, filter media characteristics such as effective grain size, depth and type, filter operating parameters including degree of flow surges and filtration rate, and achievement of optimum coagulation. Both direct and in-line filtration make use of polymers for coagulation, particularly polycationics, which are polyamines having low to moderate molecular weight and high cationic change density. **ADVANCED WASTEWATER TREATMENT PLANT WITH DESIGNED-IN RELIABILITY,**
Stevens, Thompson and Runyan, Inc., Portland, Oreg.
L. K. Anderson.
Public Works, Vol 106, No 6, p 81-84, June, 1975. 2 fig.

Descriptors: *Planning, *Treatment facilities, *Waste water treatment, *Tertiary treatment, Construction, Financing, Rivers, Water pollution, Reservoir storage, Activated sludge, Filtration, Chlorination, Effluents, *Oregon.
Identifiers: Washington County(Oreg), Tualatin River, Chemical treatment.

In the mid-1950's the rapidly growing suburban area of Washington County, Oregon, faced sewage collection and treatment problems due to lack of a master plan; by the mid-1960's the urban creeks had become open sewers. A waste water management plan was drawn, which called for the formulation of an area-wide agency responsible for financing, constructing, and operating the proposed regional facilities. The United Sewerage Agency of Washington County was established. The master plan called for the elimination of all treatment plants in the tributaries of the Tualatin, the major river, and the construction or expansion of six major plants on the river itself. The first and largest of the new facilites is the Durham Advanced Wastewater Treatment Plant, which will have a 20 mgd capacity upon completion. It can be expanded to 60 mgd. Reliability is a critical factor in this plant, as it is located in a residential area, and because of the need to minimize pollutant discharges to the Tualatin River, especially in the low river flow season (May to November). Flow augmentation is part of the total design, for which purpose multipurpose storage reservoirs were constructed upstream. During the rest of the year less stringent discharge standards are in effect; a conventional activated sludge plant, which has automatic surge and bypass control, meets these requirements. Advanced treatment features of the plant include chemical treatment and filtration prior to chlorination and discharge of the effluent from the activated sludge process, and preparation of organic sludge for incineration. **A PLANT GROWS IN BROOKLYN,**
Hazen and Sawyer, New York.
C. R. Walter, and J. Lastihenos.
Water and Wastes Engineering, Vol 12, No 6, p 36-42, June, 1975. 7 fig.

Descriptors: *Waste water treatment, *Sewage treatment, *Treatment facilities, Interceptor sewers, Screens, Pumps, Settling basins, Aeration, Sludge treatment, Sludge disposal, Chlorination, New York.
Identifiers: Skimmers, High-rate digesters, *New York(NY).

The expansion and modernization of New York City's 26th Ward Water Pollution Control Plant was completed in May 1975 at a cost of $43 million. The existing regulators on the interceptor sewers were modernized to handle storm overflow automatically. The original screens were replaced by new units about 40 feet long, with a conveying mechanism carrying the screenings to dry, above-grade screen chambers. Grit removal is performed in cyclone degritters on a sludge/grit mixture taken from the preliminary settling tanks. Main sewage pumps were replaced with units incorporating variable speed controls. Automatic skimmers and new safety and sludge handling units were added to the preliminary settling tanks. The aeration process was upgraded by the installation of modern air diffusers and high-efficiency electrostatic air filters, the establishment of new step-aeration feed points, and the repair of joints in the aeration tanks. The eight original folded-flow final settling tanks were combined into four straight-flow tanks and equipped with modern sludge collection and scum removal equipment. Three new final tanks were also constructed. Two new chlorine contact tanks were installed with a total capacity of one million gallons. The hypochlorite storage and feed equipment was modernized and automated. Four new gravity thickeners were installed. Two of the original floating-cover digesters were modernized to fully mixed, high-rate digesters. The two other units were converted to sludge storage tanks. (Orr-FIRL)

**NOVEL WASTE TREATMENT VARIATION SHOWS GREAT PROMISE,**
C. Brucker.
Water and Pollution Control, Vol 113, No 6, p 17, 19, 37-39, June, 1975. 3 fig.

Descriptors: *Waste water treatment, *Sewage, *Activated sludge, Domestic wastes, Industrial wastes, Biochemical oxygen demand, *Settling basins, Sludge, Treatment facilities, Aeration, *Aeration, *Recycling.
Identifiers: Activation tank, *France, Cheese production wastes, *Brucker system.

A novel variation of the activated sludge technique for treating domestic sewage has been developed and patented. The Brucker system has been in operation in a plant in France for more than a year, and has been described as a single combined activation and settling tank that incorporates an aerating and recycling device. The unit treats waste water from a cheese plant at 170 kg of BOD per day. The waste receives no pre-treatment before entering the 180 cu m tank, and has a mean BOD of 2,000 mg/liter with peaks up to 5,000 mg/liter and pH from 4 to 11.5. The sewage is purified during its passage in horizontal flow through the single, combined, activation and settling tank of an elongated rectagular shape. Incoming sludge is received at the upstream end of the tank in a grit compartment bounded by a siphon partition. The tank has two zones, activation and settling, the volumes of which are variable. Sedimented sludge is sucked up by a screw pump, delivered upstream, and sprayed into the air. The oxygenated biological mass falls to the surface of the liquid in the tank, flocculates in the activation zone, and falls towards the bottom of the tank before being carried away by the screw pump to be recirculated. Energy consumption of the treatment plant is 130 kWh/day. (Murphy-FIRL)

**THEY'RE PACKING UP WASTE PONDS.**
Chemical Week, Vol 116, No 24, p 37, June 11, 1975.

Descriptors: *Packed beds, *Biological treatment, *Anaerobic digestion, *Liquid wastes, Microorganisms, Sewage Treatment, *Waste water treatment, Industrial waste, Methane.
Identifiers: Anflow unit, Biological reactors, Chemicals recovery.

An upflow packed-bed biological reactor, called an Anflow unit, has been developed by Union Carbide. This system is applicable for anaerobically treating liquid wastes from sewage and from various industries and in converting these wastes into chemicals or fuels. Liquid wastes are pumped into the bottom of this system and travel upward through the packing. Microorganisms have been implanted on the packing material and once they have been implanted they appear to regenerate without wearing out. One such column has operated for three years without adding to the microorganisms. The Anflow process can recover methane as off-gas during treatment of liquid wastes from starch, food processing, and from domestic sewage. The retention times for the system are as low as four hours. (Kramer-FIRL)
W75-11703

**ALUMINUM SULPHATE FOR WATER TREAT MENT.**
Water Services, Vol 79, No 950, p 150-153, Apr 1975.

Descriptors: *Coagulation, *Waste water trea ment, Municipal wastes, Industrial wastes
Identifiers: *Alum, Coagulants.

Aluminum sulfate, or alum, is used as a coagula for both industrial and municipal water treatme The alum provides gelatinous precipitate hydroxide which by physical and electrochemi means entrains the suspended and colloidal mat present in water after filtration. Because most c loidal impurities in water have a negative char and alum is charged positively, collodial mat and particles of aluminum hydroxide floc are m tually attracted and form a precipitate which m be removed by filtration. The most economi form of alum for effluent treatment is Aluminof ric, available in slab block form; this substanc readily soluble in water and solutions of it can metered into an effluent flow. (Kramer-FIRL)

**THE ICI DEEP-SHAFT EFFLUENT-TR MENT PROCESS.**
Engineers' Digest, Vol 36, No 5, p 37, 39, 1975. 2 fig.

Descriptors: *Waste water treatment, *Bio treatment, Sewage, Effluents, Microorga Sludge, Costs.
Identifiers: Northumbrian Water Authorit lingham Sewage Works, *Deep-sharft ef treatment process.

A process has been developed for high-in biological treatment of sewage or biodegr industrial effluent. Based on circulating the effluent by an air-lift principle in a deep sh process also entails maintaining a cult microorganisms in the effluent which are supplied with air, so that high treatment achieved. The shaft is divided into two sec downcomer and a riser. At the shaft head disengagement basin. Compressed air is i into the riser at shallow depth. As circul established, the air is transferred downcomer where it is deawn down by liqu

Shaft depth can be from 100 to 300 meters chieved by conventional drilling and mining echniques. The air which provides the microor-anisms with oxygen also initiates circulation, hich makes the process simple and economical. Other advantages of this process are that the ajor part of the treatment stages are un-erground, thereby eliminating odor, and there is a inimal land requirement. The quantity of sludge roduced is half that of the conventional activated ludge process, resulting in a substantial cost eduction. A pilot plant has been operating suc-essfully since mid-1974 at the Billingham sewage orks of the Northumbrian Water Authority. Murphy-FIRL)

IDROTHERM DESALINATION,
ommonwealth Scientific and Industrial Research rganization, Melbourne (Australia). Div. of hemical Technology.
. A. Bolto.
hemtech, p 303-307, May, 1975. 10 fig, 14 ref.

escriptors: *Desalination, Effluents, Ion xchange, *Australia, Water treatment, *Waste ater treatment, Resins.
entifiers: *Sirotherm process.

n Australian desalination process has been eveloped which uses ion exchange resins but hich achieves regeneration of the salt-loaded sins whith hot water, rather than with chemicals. he process is effective on waters having up to 00 mg/liter is dissolved salts, but is not suitable r the treatment of seawater. This Sirotherm ocess is economically and environmentally asible for desalting low-salinity waters of natural industrial origin because there are no costs for emicals and the amount of waste salt discharged the effluent is reduced significantly. A mixture weakly basic and weakly acid resins is utilized hereby exchange sites are formed by proton nsfer from the acidic to the basic groups, as in e overall equilibrium which is heat-sensitive. In der to best use the thermal regeneration enomenon, it was necessary to develop special sins with capacities for salt adsorption plus rapid action rates. ICI Australia has plans for building commercial Sirotherm unit of 165,000 gpd pacity in an industrial factory in South Australia demonstrate the application of the process in salting low-salinity industrial facility waters. Fu-e studies, such as the desalination of sewage ef-ent, which will require pre-treatment, are being nsidered. (Kramer-FIRL)

URBAN RUNOFF AND COMBINED SEWER OVERFLOW, (LITERATURE REVIEW),
National Environmental Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
R. Field, and D. Knowles.
Journal Water Pollution Control Federation, Vol 47, No 6, p 1352-1369, June, 1975. 155 ref.

Descriptors: *Storm runoff, *Reviews, *Combined sewers, *Urban runoff, *Waste water treatment, Pollutant identification, Water management, Monitoring, Computers, Overflow, Bibliographies.
Identifiers: Nonpoint pollution sources.

A literature review of current research on storm water runoff and combined sewer overflow problems is presented. Nonpoint pollution sources are becoming increasingly important. Such urban land runoff pollutants include organic materials with significant amounts of oxygen demand and suspended solids, sediment from urban construction or erosion, unprotected croplands, air pollution fallout, heavy metals such as oil containing lead used for road dust control, highway deicing salts, and chemical fertilizers containing nitrogen and phosphorus. Alternatives for management of storm water pollution were categorized as: source control; collection system control; storage and treatment; and integrated (complex) systems. Runoff predictions using several mathematical methods were discussed. Effective combined waste water pollution abatement alternatives should combine control and treatment facilities. Pollution control may be achieved by computer monitoring and remote activation, by proper maintenance of drainage and sewer systems, by provisions for storage facilities, and, in some cases, by separation of sanitary and storm sewers. The applicability of biological, physico-chemical, and disinfection methods of treatment were compared, as related to overflow. The most promising approaches to urban storm flow management involve multidisciplinary systems, such as wet-period discharges, dry-period discharges, land use, and water use. Various sampling programs and flow meters are also being developed for analysis of sewer flow and waste water quality conditions. (Kramer-FIRL)

METEOROLOGICAL, TOPOGRAPHICAL, AND CONSTRUCTION INFLUENCE ON THE RAIN RUNOFF IN SEWER SYSTEMS (METEOROLOGISCHE, TOPOGRAPHISCHE UND BAUTECHNISCHE EINFLUESSE AUF DEN REGENABFLUSS IN KANAL-ISATION-SNETZEN),
S. Pfeiff.
Gesundheits-Ingenieur, Vol 96, No 5, p 140-142, May 1975.

Descriptors: *Sewers, *Rainfall, *Rainfall-runoff relationships, *Storm runoff, Design, Meteorology, Reviews, *Waste water treatment.
Identifiers: Sewer construction.

Meteorological, topographical, and construction influences on the storm runoff in sewer systems are presented. A critical review was made of existing calculation and design methods. Storm runoff analysis as applied presently in unsuitable for a proposed new coefficient-less method for network filling and runoff calculations. The runoff coefficient is unsuitable, and should be used only for approximate calculations as a ratio of the surface area with full runoff to the total runoff surface. Flow velocity as a parameter should be replaced by throughput in liters/sec and filling should be expressed in liters/min; the term runoff retardation should be abandoned completely. The course of rain over time is of great influence on the storm runoff in the sewer system. A late peak in rain intensity is less favorable for the filling of the sewer system than is an early peak. Analyses of the frequency of network filling in a well-defined water capture area should be used to dimension sewer systems rather than rainfalls yielding a runoff with a definite frequency. (Takacs-FIRL)

RECYCLING OF INCINERATOR ASH,
L. L. Diosady.
Environment Canada Research Report No 19, (1974). 82 p, 13 fig, 14 tab, 37 ref, append.

Descriptors: *Sludge treatment, *Incineration, *Phosphorus, *Heavy metals, Separation techniques, Iron, Aluminum, Pilot plants, Ultimate disposal, Recycling.

A preliminary study was performed on the feasibility of recovery of iron, aluminum, heavy metals, and phosphorus from incinerated sewage sludge ash. The project included a literature review; examination of ash composition, solubility

of ash components, and separation techniques; and an economic evaluation of separation methods and an estimation of the equipment needed for a pilot plant. Aluminum and iron recovery was found to be uneconomical. Aluminum was present in the ash in the form of a refractory oxide that is not amenable to any inexpensive chemical treatment. The ash was highly varied in composition. Approximately 50% of the ash was in the chemically inert form of silicates and alumina. A large proportion of all heavy metals, especially zinc and chromium, was physically or chemically bound by these refractories, which are not available through acid digestion. The simplest approach to safe ash disposal may be to form refractories from all ash components. By adding fluxing agents, or by altering the incinerator conditions, it may be possible to produce a glasslike ash that will contain much lower quantities of leachable heavy metals than the present ash. Phosphorus, present to the extent of 14-18% expressed as phosphoric acid, has the highest economic value in the ash. It may be recovered by the use of phosphoric or 60% sulfuric acids. (Orr-FIRL)

**SLUDGE HANDLING AND DISPOSAL SEMINAR, CONFERENCE PROCEEDINGS NO. 2.**
Ontario Ministry of the Environment, Toronto. Pollution Control Branch.
Held at Toronto, Ontario, September 18-19, 1974, 465 p. Published jointly with Environment Canada, Ottawa.

Descriptors: *Conferences, *Sludge disposal, Land, Crops, Nutrients, Legal aspects, Microbiology, Environmental effects, Centrifugation, Dewatering, Filtration, Incineration, Pumping, Cities, Treatment facilities, *Waste water treatment, *Canada.
Identifiers: *Sludge handling, Metal recovery, Metal removal, Phosphate removal, Hauling.

Twenty-eight papers, mostly by Canadian authors are presented. The subjects include disposal of sludge on agricultural land with relation to crop utilization of nutrients in the sludge, land reclamation, regulatory aspects, microbiological aspects, and the potential environmental hazards of this practice. Also covered is sludge handling with regard to centrifugation, dewatering, filtration, incineration, metal recovery or removal, phosphate removal, pumping and hauling. Sludge handling and disposal practices in a regional municipality and a metropolitan area are also discussed. (See W75-11716 thru W75-11731) (Dean-FIRL)

**OVERVIEW OF CANADIAN SLUDGE HANDLING AND LAND DISPOSAL PRACTICES AND RESEARCH,**
Ontario Ministry of the Environment, Toronto.
S. A. Black, and N. W. Schmidtke.
In: Sludge Handling and Disposal Seminar, Conference Proceedings No. 2, September 18-19, 1974, Toronto, Ontario, Canada, p 1-9, (1974). 2 tab, 4 ref.

Descriptors: *Sludge disposal, *Anaerobic digestion, *Landfills, *Lagoons, *Canada, *Waste water treatment, Environmental effects, Phosphorus, Chemical precipitation, Great Lakes region, Treatment facilities.
Identifiers: Agricultural land, Canada-Ontario Agreement.

Sludge handling and disposal practices in some major Canadian cities and sludge handling practices in Ontario are discussed. The most widely used methods of disposal in Canada are anaerobic digestion, followed by placing the sludge in storage lagoons, sanitary landfills, or on agricultural lands without consideration of the environmental effect. Ontario is now involved in a phosphorus removal program. In the most critical areas of the Province the facilities were to have been in operation by December 1973, in less critical areas by December 1975, and all other areas three years after notification. Chemical precipitation will be used in the phosphorus removal facilities. Research studies included land application of sewage sludges and handling and treatment of sewage sludges under the Canada-Ontario Agreement. These studies should result in the upgrading of the treatment facilities in the Lower Great Lakes Basin. (See also W75-11715) (Dean-FIRL)

**SLUDGE HANDLING AND DISPOSAL PRACTICES IN ENGLAND,**
Agricultural Development Advisory Service, Leeds (England).
J. Webber.
In: Sludge Handling and Disposal Seminar, Conference Proceedings No 2, September 18-19, 1974, Toronto, Ontario, Canada, p 10-26, (1974). 11 tab, 12 ref.

Descriptors: *Sludge, *Sludge disposal, Land reclamation, Incineration, Bodies of water, Nitrogen, Phosphorus, Copper, Zinc, Lead, Cadmium, Mercury, *Waste treatment.
Identifiers: England, Wales, Composting, Farmland.

In England and Wales approximately 94% of the population has sewers. Four-fifths of the sewage is treated at sewage plants and used for agricultural purposes or otherwise disposed of on land. The remaining one-fifth is disposed of at sea or in estuaries after some pre-treatment. For disposal at sea, liquid sludge is taken out to deep water in specially designed barges where it is dumped. Studies of Liverpool Bay have shown no serious pollution but suggest that some accumulation of chemicals, pesticides, and metals might be harmful to marine life in the future. Sewage sludge has been used to reclaim the land at gravel pits and collieries with some success. Sewage farms near large centers of population are being used less frequently due to the value of the land for housing. Incineration and composting are other methods for sludge disposal that have been occasionally in use in England. Sewage sludge is also disposed of on agricultural lands where it is used as a source of nitrogen and phosphorus. Studies have shown that where sludges from industrial areas have been used there may be damage to crops from zinc and copper. When sludges include lead, cadmium, or mercury, there may also be a hazard to man and livestock consuming the crops. (See also W75-11715) (Dean-FIRL)

In: Sludge Handling and Disposal Seminar, Conference Proceedings No 2, September 18-19, 1974, Toronto, Ontario, Canada, p 27-45, (1974). 3 fig, 4 tab, 14 ref.

Descriptors: *United States, *Sludge disposal, *Sewage treatment, *Waste water treatment, Dewatering, Incineration, Land reclamation, Industrial wastes, Costs, Crop production, Food chains, Surface runoff, Farm management, Landfills.
Identifiers: Pollution regulations, Agricultural land, Soil productivity.

In the United States methods of handling and disposal of sewage sludge are being re-evaluated. The processing and disposal of sludge accounts for half of the cost of sewage treatment. In small communities disposal of sewage sludge by land spreading has been used for years. In larger communities dewatering followed by incineration has been used to dispose of sludge. Stricter air pollution restrictions and increased costs are making incineration less desirable. New pollution regulations applied to landfills require improved dewatering techniques. The most desirable alternatives is agricultural use of the sludge. The advantages of this method are increased crop yield and reclamation of land. An area of concerns is that heavy metals from industrial wastes may seep into the soil, causing reduced soil productivity and increases of heavy metals in the human food chain. A problem that could arise is pollution of surface water from runoff. This could be controlled by proper management. (See also W75-11715) (Dean-FIRL)

**AEROBIC AND ANAEROBIC SLUDGE DIGESTION,**
Ontario Ministry of the Environment, Toronto. Pollution Control Branch.
B. I. Boyko.
In: Sludge Handling and Disposal Seminar Conference Proceedings No 2, September 18-19, 1974, Toronto, Ontario, Canada, p 46-62, (1974). 3 fig.

Descriptors: *Anaerobic digestion, *Aerobic treatment, *Sludge treatment, *Waste water treatment, Enzymes, Microorganisms, Oxidation, Treatment facilities.
Identifiers: Acid fermentation, Alkaline fermentation, Organic pollutants.

The goal of water pollution control plants is to produce high quality effluents. This is achieved through the removal of organic pollutants. A process which produces quantities of sludge requiring pre-treatment before disposal. Digestion is the method by which these sludge solids are treated. Anaerobic digestion is a biochemical process taking place in the absence of oxygen through the action of enzymes and microorganisms. It is a two phase process consisting of an acid fermentation phase and a methane phase. Aerobic digestion is a biological process involving oxidation of bio-degradable matter by microorganisms and microbial cellular material by endogenous respiration. Both methods can be inhibited by toxic materials. When the two methods are compared for performance they should not be considered as equal alternatives for sludge treatment. The size and usage of the facility are among factors determining the choice of the method to be applied. (See also W75-11715) (Dean-FIRL)

**DESIGN INFORMATION ON DEWATERING PROPERTIES OF WASTEWATER SLUDGES,**
National Environmental Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
J. B. Farrell.
In: Sludge Handling and Disposal Seminar Conference Proceedings No 2, September 18-19, 1974, Toronto, Ontario, Canada, p 269-279 (1974). 2 tab, 11 ref.

Descriptors: *Sludge treatment, *Dewatering, *Nutrient removal, Phosphorus, Lime, Aluminum, Iron, Equipment, Costs, Treatment facilities, *Waste water treatment.
Identifiers: Sludge yield.

Information on the handling of sludges produced by phosphate removal processes is presented. To design a minimum cost facility, it is necessary to 'cost out' a number of potential process options in order to identify the more economical approach. A large part of the plant cost is dewatering. Tests are presented whereby sludge yields can be estimated. The mass of chemical sludge produced when iron or aluminum salts are used has usually been estimated from simplified stoichiometric relationships; however, experimental data suggest that these estimates are low and should be increased by up to 35%. The mass of sludge produced by lime addition depends on the dose

ne required, the alkalinity of the waste water, id to a small degree on the phosphate content of e waste water. Calculated lime sludge doses ould be increased by 20%. Field visits have also en made to plant sites with a sludge dewatering ailer. The site visits make it possible to compare fectiveness of various dewatering devices, com- re the performance of the dewatering equipment the plant with the equipment in the trailer, and serve at a number of sites how the performance each device is affected by differences in sludge pe and waste water source. scriptors: *Treatment facilities, *Sludge treat- nt, Effluents, Nitrogen, Carbon, Phosphorus, ae, Dewatering, *Waste treatment.
ntifiers: Phosphorus removal, Lime treatment.

The Canada-Ontario Agreement on Great Lakes Water Quality of 1971 specifies that the levels of nitrogen, carbon, and phosphorus considered essential for the growth of algae be drastically reduced in waste treatment plant effluents. Pilot plant studies provided data on sludge production and properties. Sludge production and characteristics were altered by adding phosphorus removing chemicals. These chemical additions resulted in an increase in total solids production and sludge volume and had a harmful effect on dewatering characteristics. In most cases the introduction of chemical treatment will result in the need to increase sludge handling facilities. Lime treatment is the notable exception. The improvment in dewatering was such that the handling facilities could be reduced even though the sludge solids increased. (See also W75-11715) (Dean-FIRL)

**CENTRIFUGES - TYPES AND APPLICATIONS,**
Penwalt Corp., Warminster, Pa. Sharples-Stokes Div.
F. W. Keith, Jr.
In: Sludge Handling and Disposal Seminar, Conference Proceedings No 2, September 18-19, 1974, Toronto, Ontario, Canada, p 351-368, (1974). 10 fig.

Descriptors: *Treatment facilities, *Sludge, Polymers, Centrifugation, *Waste water treatment, Equipment, Industrial wastes, Municipal wastes, Sludge treatment, Thickening, Dewatering.
Identifiers: *Centrifuges, Disc centrifuge, Scroll centrifuge, Imperforate bowl knifing centrifuge.

Three types of centrifuges are currently being used in municipal and industrial waste treatment plants for thickening or dewatering. The scroll type centrifuge is most commonly used. Because of its design it can be used for almost all sludges containing primary solids as well as for those with lime added for phosphorus removal. In order to handle soft secondary sludges a polymer must be added. The imperforate bowl knifing centrifuge has been successful with biological sludges and handles alum sludges readily. The main advantage is a recovery of 90-95% without a polymer. The disc centrifuge is used for the thickening of clean secondary activated sludge. It has had recovery rates of 85-90% without a polymer. The three types of centrifuges may be used separately or in combination. (See also W75-11715) (Dean-FIRL)
W75-11725

**SLUDGE DEWATERING USING THE KRUGER CENTRIFUGE,**
L. P. Roe.
In: Sludge Handling and Disposal Seminar, Conference Proceedings No 2, September 18-19, 1974, Toronto, Ontario, Canada, p 369-384. (1974) 1 fig.

Descriptors: *Dewatering, *Sewage sludge, Canada, Polymers, Equipment, Centrifugation, *Waste water treatment, Operation.
Identifiers: *Centrifuges(Kruger).

The use of solid bowl decanter centrifuges for dewatering sewage sludges is now becoming common in Canada. The decanter centrifuge advantages are that it requires little operator attention and operates continuously. Its disadvantages are wear on the solids conveying scroll by the abrasive action of grit in the sludge and poor solids capture. Work has been done to overcome these disadvantages. Design improvements were made and the use in recent years of synthetic polymer flocculant aids has improved the solids capture. By lowering the g-force and scroll differential speed and by using an efficient degritting system abrasive wear can be lowered. Sludge dewatering investigations have been carried out at various treatment plants in Canada using the improved centrifuge. Performance varied according to the type of sludge. The decanter centrifuge is relatively easy to maintain, having only two major moving parts; the scroll and the bowl. The solid conveying scroll requires the most maintenance. To shorten the downtime, it would be advantageous to have a spare scroll available. (See also W75-11715) (Dean-FIRL)
W75-11726

**VACUUM DEWATERING OF SEWAGE SLUDGE,**
G. D. Kemp.
In: Sludge Handling and Disposal Seminar, Conference Proceedings No 2, September 18-19, 1974, Toronto, Ontario, Canada, p 385-390, (1974). 2 fig, 1 tab.

Descriptors: *Filters, *Dewatering, *Sludge, Lime, Polyelectrolytes, *Waste water treatment, Sludge treatment, Activated sludge, Canada.
Identifiers: *Vacuum filters, Ontario, Ferric chloride, Alum.

Vacuum filters are being used at plants in Ontario to dewater raw sludge conditioned with polyelectrolytes or ferric chloride and lime, and in one case thickened waste activated sludge conditioned with a polyelectrolyte. The filter mediam used in many of the filters in Ontario are stainless steel springs. Fabric is the other filter medium used. The purpose of a vacuum filter is to achieve the dryest filter cake using the least amount of coagulant at the highest drum speed. Tests can be made to determine the proper amount of coagulant needed. Alum, lime, or ferric chloride are being used for reduction of nutrients at most of the plants using vacuum filters. Alum has had some effect on the amount of filter yield while lime and ferric chloride have not. (See also W75-11715) (Dean-FIRL)

**ASPECTS OF INCINERATING CHEMICAL SLUDGES,**
Environmental Protection Service, Burlington (Ontario). Waste Water Technology Center.
E. E. Shannon, D. Plummer, and P. J. A. Fowlie.
In: Sludge Handling and Disposal Seminar, Conference Proceedings No 2, September 18-19, 1974, Toronto, Ontario, Canada, p 391-412, (1974). 8 fig, 7 tab, 15 ref.

Descriptors: *Incineration, *Sludge disposal, Waste disposal, Municipal wastes, North America, Europe, Dewatering, Sludges, Canada, United States, *Waste treatment.
Identifiers: Furnaces.

Incineration has been used as one of the cheapest methods of sludge disposal by large municipalities. The three types of incinerators are the multiple hearth furnace which is the most common method of incinerating sewage sludges in North America and Europe, the fluidized bed furnace, and the rotary kiln furnace which has not been extensively used although it has the potential for handling thickened sludge directly. In incineration systems the most critical pretreatment step is sludge dewatering. In view of the potential problems involved in the incineration of phosphorus removal sludges, a sludge incineration and precipitant recovery program was initiated. The preliminary results showed that the calorific value of the chemical sludges varies with the type of sludge. The lime sludge did not present any problems but with the alum and iron sludges there is the possibility of clinker build-up. It is possible to recover iron and other heavy metals from incinerator ash. S(See also W75-11715) (Dean-FIRL)

**REMOVAL OF PHOSPHATES AND METALS FROM SEWAGE SLUDGES,**
Waterloo Univ., (Ontario). Dept. of Chemical Engineering.
D. S. Scott, and H. Horlings.

In: Sludge Handling and Disposal Seminar, Conference Proceedings No 2, September 18-19, 1974, Toronto, Ontario, Canada, p 413-443, (1974). 5 fig, 7 tab, 6 ref.

Descriptors: *Waste water treatment, *Treatment facilities, *Nutrient removal, Sludge, Iron, Aluminum, Zinc, Phosphates, Phosphorus, Heavy metals, Filters, Extraction, *Chemical precipitation.
Identifiers: Agricultural land, *Phosphate removal, Experimental work, Chemical treatment.

Now that waste water treatment plants are using chemical treatment for the removal of phosphates the sludges produced will not only contain phosphate but metals such as iron and aluminum used as coagulants or in the removal process. The sludges will also contain the phosphorus and metals that entered the plant. The removal of phosphates and metals from sewage sludges has become important particularly when the sludges are used on agricultural lands. Experimental work has been done on the extraction and precipitation of metals from filter cake. The metals and phosphorus could be extracted by acid from either unconditioned or conditioned final anaerobic digested sludges. The control of the pH was important in the production of solid products containing iron and aluminum in one case and heavy metals in the other. Iron, aluminum, zinc, and phosphate can be recovered by further treating the solid products by conventional means. (See also W75-11715) (Dean-FIRL)

**SLUDGE HANDLING AND DISPOSAL PRACTICES IN THE REGIONAL MUNICIPALITY OF NIAGARA,**
Regional Municipality of Niagara, Niagara Falls (Ontario). Public Works Dept.
E. R. Simonen.
In: Sludge Handling and Disposal Seminar, Conference Proceedings No 2, September 18-19, 1974, Toronto, Ontario, Canada, Toronto, Ontario, p 444-451, (1974). 2 tab.

Descriptors: *Treatment facilities, Anaerobic digestion, Aerobic treatment, *Sludge disposal, Research and development, Landfills, Sludge treatment, Canada, Sludge treatment, Waste water treatment.

An act of the provincial government established the Regional Municipality of Niagara on January 1, 1970. The area is 719 square miles with a population of approximately 350,000. The region is comprised primarily of rural and agricultural land with about 70% of the population concentrated at St. Catharines, Niagara Falls, and Welland. At present the region has twelve sludge producing plants. This will be reduced to eight as new plants are completed. Anaerobic digestion is used except at the Crystal Bay, Chippawa, and Grimsby plants. Aerobic digestion is used at the Crystal Bay plant. The Chippawa plant will be phased out upon completion of the south side sewer scheme at which time its sludge will be treated at the Niagara Falls plant. Ainoperative digester is being used as a holding tank for raw sludge at the Grimsby plant and the sludge is treated at one of the larger plants. The digested sludge in the region is disposed of on land, offered to the public for use, or disposed of at landfills. The region has also been involved in research projects. Various types of vehicles for spreading sludge on fields were tested amd a spraying system was investigated. Computer selection of various sludge disposal alternatives was evaluated. **SLUDGE HANDLING AND DISPOSAL PRACTICES IN METROPOLITAN TORONTO,**
W. A. Salih.
In: Sludge Handling and Disposal Seminar Conference Proceedings No 2, September 18-19, 1974, Toronto, Ontario, Canada, p 452-465, (1974) 1 fig, 2 tab.

Descriptors: *Treatment facilities, *Sewerage, *Sludge disposal, Anaerobic digestion, Polymers, Lime, Centrifugation, Filtration, Incineration, Landfills, Dewatering, Canada, *Waste disposal, *Waste water treatment.
Identifiers: *Toronto(Canada), Thermal processing, Ferric chloride.

In 1954 when Metropolitan Toronto was created there were 17 treatment plants operating in Toronto and its suburban municipalities with two plants under construction. A sewerage system plan put into effect in 1954 provided for trunk sewers to convey waste water to four major plants. By the 1960's the smaller plants had been taken out of service and the sludge disposal consolidated at the four treatment plants. All four plants process the sludge by anaerobic digestion followed by conditioning with polymers or ferric chloride and lime then centrifugation or vacuum filtration. The sludge is disposed of by hauling to landfill areas, incineration, or air drying storage and removal by the public for use as soil conditioners. Future plans for expansion of the main treatment plants are as follows: Highland Creek Treatment Plant will increase its capacity from its present 16 mgd to 64 mgd and the sludge will be processed by thermal processing, dewatering and incineration; Humber Treatment Plant will increase from 62 mgd to 120 mgd and the sludge dewatered and hauled to the Main Treatment Plant for incineration; and modernization of the present facilities is under consideration for the North Toronto Treatment Plant. **HEAT TREATMENT OF SEWAGE SLUDGE,**
Public Works Research Inst., Tokyo (Japan).
K. Saito.
In: 3rd US-Japan Conference on Sewage Treatment Technology Proceedings, February 12-16, 1974, Tokyo, Japan, p 20-64, May 1975 6 fig, 12 tab.

Descriptors: *Sewage treatment, *Sludge treatment, *Heat treatment, Dewatering, *Waste water treatment, Maintenance, Recycling, Equipment, Costs, Sludge, Odor, Treatment facilities.
Identifiers: Japan, Odor removal.

Results of a three-year investigation of facilities for heat treatment of sewage sludge are presented. Care must be taken for prevention of corrosion and organic deposition. Heat treated sludge dewaters easily and can be burned without the use of additional fuel. However, three major problems of this method persist. These are: removal of odors from the treatment process; treatment of supernatants having high BOD, including removal of nitrogen compounds and heavy metals; and the need to establish operation and maintenance systems for periodic inspection. In order to implement a heat treatment system, optimum operating conditions must be determined by quality of supernatant for each particular sewage treatment facility. It is desirable to establish a closed system for heat treatment, where heat from incineration of the cake is recycled and odorous gases are reused as combustion air. In addition, it is recommended that equipment be standardized in order to simplify quality control and for cost reduction. (Prague-FIRL)

**COMBINED TREATMENT OF MUNICIPAL AND INDUSTRIAL WASTEWATER,**
Yokohama Sewerage Bureau, Kanagawa (Japan).
M. Sato, H. Fujii, and S. Yasuda.
In: 3rd US-Japan Conference on Sewage Treatment Technology Proceedings, February 12-16, 1974, Tokyo, Japan, p 65-127, May 1975 12 fig, 24 tab.

Descriptors: *Waste water treatment, *Pre-treatment, Industrial wastes, Municipal wastes, Facilities, Aeration, Oxygen.
Identifiers: *Combined municipal-industrial waste treatment, *Kyoto(Japan).

Systems for combined treatment of municipal and industrial waste water require consideration of technical knowledge, expense allotment, and administrative measures. Factors concerning combined treatment are discussed for systems with and without pre-treatment of industrial waste waters. Described are the Torihama industrial waste water pre-treatment plant, the combined treatment of industrial and domestic waste water at Shingashi Valley, and the combined treatment of industrial and municipal waste water in kyoto. In the Kyoto treatment plant, comparisons between pure oxygen aeration and the conventional air system demonstrated that pure oxygen aeration is useful for treatment of highly polluted sewage with a variable load. **STUDIES ON ADVANCED WASTE TREATMENT,**
Public Works Research Inst., Tokyo (Japan).
M. Kashiwaya, and S. Nanbu.
In: 3rd US-Japan Conference on Sewage Treatment Technology Proceedings, February 12-16, 1974, Tokyo, Japan, p 128-188, May 1975 24 fig, 1 tab, 4 ref.

Descriptors: *Tertiary treatment, *Lime, Pilot plants, Municipal water, Activated sludge, Filtration, Adsorption, Suspended solids, Biological treatment, *Waste water treatment, *Chemical precipitation.
Identifiers: *Japan, Water quality matrices, *Chemical treatment.

Results of laboratory and pilot scale tests concerning lime precipitation in municipal waste water are given from two areas in Japan. Pilot plant installations at the Shita-machi Sewage Treatment Plant in Yokosuka and at the partially completed Tobi Sewage Treatment Plant in Kyoto are described. In Japan, 71% of the municipal sewage treatment plants use the activated sludge method. However, organic suspended solids are not always removed from the final settling tanks of this process. The down-flow filtration process is being investigated as well as an up-flow type granular activated carbon adsorption system. Treatability of waste water may be evaluated, based on water quality matrices; variables used were impurity size, chemical property, and concentrattion. For removal of organics, three water quality indices such as TOC, and ultraviolet absorbance of 260 (E260) and 220 (E220) millimicron meters connected with impurity size distribution could describe the usefulness of biological treatment, chemical coagulation, carbon adsorption, or other treatment processes. (Prague-FIRL)

rd US-Japan Conference on Sewage Treat- Technology Proceedings, February 12-16, Tokyo, Japan, p 239-244, May 1975 4 ref.

riptors: *Sludge treatment, *Sludge disposal, as, *Waste water treatment, Rural areas, n areas, Dewatering, Anaerobic digestion, ated sludge, Municipal wastes.
ifiers: *Sludge handling, *Land application.

e handling in small plants in rural areas of s is successfully accomplished by anaerobic tion with dewatering on open beds and sub- nt land application. For small plants located ban areas, a trend is toward aerobic rather anaerobic digestion. This is due to extensive f contact stabilization treatment plants which best utilizing aerobic digestion, and various nce problems which are associated with obic sludge handling. One technique used in ton, for transporting excess activated sludge plants with no dewatering facilities to a e processing plant is the pumping of sludge ressure conduits to a sanitary sewer which flows to major plants. At larger municipal s, a variety of sludge disposal techniques been applied. Descriptions are given of the ge treatment facilities of the City of Houston, ulf Coast Waste Disposal Authority, the City stin, and the City of San Antonio. Larger s in arid areas will continue utilizing sludge ning where feasible. Where final disposal is y landfill, vacuum filters will be used for de- ing; where ultimate disposal is fertilizer ction or long-distance landfill, pressure fil- re likely to be used. (Prague-FIRL)

aluminum salts, iron salts, and/or lime are n the physical-chemical treatment of waste to remove phosphate, the sludge mass in- es and dewatering properties are affected. asses of sludge formed from each treatment can be calculated from chemical equations. Aluminum and iron salts generally reduce the solids content of primary clarified sewage so that sludges cannot be thickened to as high a solids content. With lime, the opposite result occurs. Thickening and dewatering properties are substantially improved and sludge conditioning agents can often be eliminated. While the mass of sludge is generally higher with lime treatment, the volume is often lower than when Al or Fe salts are used. Tests of treatment with these chemicals were conducted under plant conditions at Little River, Ontario, and at Blue Plains in Washington, D.C., at Contra Costa, California, and at Salt Lake City, Utah. Results indicated excellent sludge characteristics, such as filter yielded and sludge concentration, with lime treatment. Modifications in clarifier design are being investigated to improve Al and Fe sludge treatment. (Prague-FIRL)

**EPA EXPERIENCES IN OXYGEN-ACTIVATED SLUDGE,**
National Environmental Research Center, Cincinnati, Ohio. Advanced Waste Treatment Research Lab.
E. F. Barth.
In: 3rd US-Japan Conference on Sewage Treatment Technology Proceedings February 12-16, 1974, Tokyo, Japan, p 283-357, May 1975, 26 fig, 26 tab, 7 ref.

Descriptors: *Aeration, *Oxygen, *Waste water treatment, Biological treatment, Treatment facilities, Sludge treatment, Sludge disposal, Administration, *Sewage treatment.

The role of the EPA between 1968 and 1974 in the development of the oxygen aeration process is summarized. Facilities from seven projects are detailed. These are: Batavia I and II (Union Carbide Corporation), the purpose of which was to establish the feasibility of a multi-stage, covered-tank oxygenation concept; Newtown Creek (New York City), where scaled-up demonstration of the multi-stage, covered-tank oxygenation system was investigated; Las Virgenes (California) Municipal Water District, which demonstrated the single-stage, covered-tank oxygenation system; FMC Corporation, which hoped to establish the feasibility of the open-tank oxygenation concept; the EPA/District of Columbia (Blue Plains) Pilot Plant, to determine the process kinetics over a wide range of operating conditions; the Bureau of Reclamation, which tested materials of construction for corrosion potential; and the Rocketdyne Division of Rockwell International, which planned to define safety requirements and to develop a safety manual and checklist. As a result of these studies, it was concluded that oxygenation systems are equally applicable to the construction of new facilities and the upgrading of existing secondary treatment plants. Such systems should be designed as integrated packages, with a biological reactor, a secondary clarifier, and sludge handling equipment. Further work should verify or contradict data which indicate that reduced excess biological sludge production is possible with oxygenation. (Prague-FIRL)

**AERATION SYSTEMS FOR METRO CHICAGO,**
Metropolitan Sanitary District of Greater Chicago, Ill.
B. T. Lynam, S. Graef, and D. Wunderlich.
In: 3rd US-Japan Conference on Sewage Treatment Technology Proceedings, February 12-16, 1974, Tokyo, Japan, p 358-392, May 1975 5 fig, 5 ref.

Descriptors: *Aeration, Design criteria, Treatment facilities, Mathematical studies, Activated sludge, Economics, *Waste water treatment, Illinois.
Identifiers: *Chicago(Ill), *Bubble aeration.

Aeration systems for the greater Chicago area are described. Development of aeration technology involved diffuser plate studies for permeability, uniformity, and diffuser plate rating. More recent work concerned instream aeration, basin aeration, and small plant design and modification. Fine bubble aeration practices, involving intakes, filters, blowers, air mains, and aeration tanks, are detailed. From investigations since 1920, the Metropolitan Sanitary District of Greater Chicago has made contributions in diffuser permeability criteria, design and operation of primary and secondary air filters, and aeration tank configuration and diffuser placement. Mathematical relationships for oxygen transfer have been formulated. An overall effective economic technology for activated sludge treatment has been developed. (Prague-FIRL)

**OXYGEN ACTIVATED SLUDGE SYSTEMS IN TEXAS,**
Texas Water Quality Board, Austin.
D. Whittington, and T. B. Tischler.
In: 3rd US-Japan Conference on Sewage Treatment Technology Proceedings, February 12-16, 1974, Tokyo, Japan, p 393-399, May 1975 3 ref.

Descriptors: *Waste water treatment, *Texas, *Sludge treatment, Odors, Oxygen, Personnel, Operation, Maintenance, Monitoring, Economics, Municipal wastes, *Activated sludge.
Identifiers: *Unox Process, Hydrocarbons, Pure oxygen treatment.

Pure oxygen systms for waste treatment, particularly the Unox Process, are discussed in terms of the applicability of this system to facilities in Texas. Four small to medium size Unox systems are under construction or in planning stages for Texas municipalities. The advantages of this process include reductions in biological reactor volumes, higher oxygen-transfer efficiencies, improved sludge handling characteristics, simplified process control, and odor control. Some possible disadvantages are that the more sophisticated mechanical and electrical control systems may not be operated by all treatment plant personnel. Also, there is a possibility of volatile hydrocarbons entering the enclosed system, which could lead to a serious explosoion. For this reason, a monitoring device for hydrocarbons is installed in each Unox unit, and should be properly maintained. Because of reduction of tank volumes and land area needed, the Unox process may be a viable future alternative to conventional activated sludge treatment for Texas. This is especially trud in large municipal plants, where an economic advantage results. (Prague-FIRL)

**SUSPENDED SOLIDS REMOVAL PROCESSES STUDIED AT METRO CHICAGO,**
Metropolitan Sanitary District of Greater Chicago, Ill.
B. T. Lynam, D. R. Zenz, C. Lue-Hing, and G. R. Richardson.
In: 3rd US-Japan Conference on Sewage Treatment Technology Proceedings, February 12-16, 1974, Tokyo, Japan, p 400-488, May 1975 15 fig, 4 tab.

Descriptors: *Suspended solids, *Waste water treatment, *Pilot plants, Hydraulic properties, Filters, Filtration, Effluents, Equipment, Solid wastes, Illinois, Treatment facilities.
Identifiers: *Hydraulic loading, *Microstrainers, *Chicago(Ill).

Metro Chicago has investigated its suspended solids removal processes by full-scale and pilot studies. At Hanover Park, a full-scale evaluation of sand filtration and microstraining was carried out in order to determine maximum suspended solids loading and maximum hydraulic loading to both the sand filter and the microstrainer. Pilot

plant studies evaluated three devices, the DeLaval filter, the Neptune Microfloc Unit, and the Graver Filter. All filtration units were capable of producing effluent suspended solids and BOD of under 10 mg/liter. The Graver pressure filter can be successfully operated at higher hydraulic loadings (9.0 gpm/sq ft) and suspended solids loadings (1.9 lbs/sq ft) than the other two units. The Neptune Microfloc Unit achieved the best effluent quality, with less than 6.0 mg/liter of suspended solids and BOD. A 15 mgd rated capacity microstrainer at the north side treatment works of the District was also evaluated. The various test results were compared, indicating that microstrainer flow capacity is very much dependent upon the type of effluent solids. Additionally, sand filters are capable of achieving better suspended solids removal than microstraining devices, and batch type filters appear to be capable of loadings over 1.2 lbs/sq ft/filter run. (Prague-FIRL)

**METRO CHICAGO STUDIES ON NITRIFICATION,**
Metropolitan Sanitary District of Greater Chicago, Ill.
B. T. Lynam, D. R. Zenx, C. Lue-Hing, G. R. Richardson, and B. T. Washington.
In: 3rd US-Japan Conference on Sewage Treatment Technology Proceedings, February 12-16, 1974, Tokyo, Japan, p 449-503, May 1975 17 fig, 5 tab, 6 ref.

Descriptors: *Nitrification, Ammonia, Nitrogen, *Waste water treatment, *Illinois, *Treatment facilities.
Identifiers: *Chicago(Ill).

Nitrification was tested in the Chicago area at three facilities. A two-stage nitrification process at Hazlecrest, Illinois, produced an effluent high in nitrate-nitrite and low in ammonia concentrations at a 3.0 to 5.0 hour detention time in the second stage. Temperature effects were a major factor for both initiating and maintaining nitrification. At the Calumet Sewage Treatment Plant, a pilot plant process steps included preliminary and secondary treatment, anaerobic sludge digestion, and contact chlorination. Under such a second-stage nitrification system, a nitrified effluent with an ammonia nitrogen residual of under 2.5 mg/liter could be produced with: influent NH3-N, 10 to 25 mg/liter, SRT of at least ten days, and a minimum operating temperature, 12 to 15C. A Water Reclamation Plant at Lemont, used nitrification and employed extended aeration. When operated at long detention times, with sewage temperatures as low as 45 F, a well-nitrified effluent was produced. The concept of single-stage nitrification at all major plants in the Chicago area is being tested a pilot scale levels. A new plant under construction at West-Southwest will have a maximum flow capacity of 26 mgd, detention time, 5.5 hours, with return sludge flow capability of 26 mgd. The Metropolitan Sanitary District of Greater Chicago policy toward nitrification at future full-scale plants has not yet been decided. (Prague-FIRL)

**A SURVEY OF THE TOKYO METROPOLITAN SHIN-KASHI TREATMENT PLANT, (TOKYO-TO SHINKASHI SHORIJO NO GAIYO),**
T. Nagahama.
Gesuido Kyokai-shi, (Jour Japan Assn of Sewage Works), Vol 11, No 125, p 67-75, 1974.

Descriptors: *Waste water treatment, *Sewage treatment, *Industrial wastes, Municipal wastes, Precipitation(Chemical), Facilities.
Identifiers: *Tokyo(Japan).

The Tokyo Shin-Kashi sewage treatment plant, an advanced and final stage treatment plant which is needed to keep the water quality to a pH between 5.8 to 8.6, to below 20 mg/liter for BOD, and to below 70 mg/liter for SS, is described. The plant treats both municipal waste water and treated industrial waste water which have flowed into the plant through separate drainages. The total input of water to the plant is 380,000 cu m/day and is expected to increase to 940,000 cu m/day with the completion of other drainages now under construction. The industrial waste water is pre-treated separately from the municipal waste water. A pH adjustment, additional aeration treatment, and chemical precipitation treatment are given to the industrial water before mixing it with municipal waste water at a pre-aeration tank. The mixed waste water is fed into a primary precipitation pond, then an aeration tank, a final-precipitation pond, and a chloride mixing tank. The purification efficiency of waste water in this plant is much higher than those plants treating the mixture of both municipal and industrial water without industrial water pre-treatment. Both operational and dimensional details of individual treatment facilities are presented. (Katayama-FIRL)

M. Bolla, and G. Dini.
Rassegna Chimica, Vol 26, No 3, p 155-158, May/June, 1974. 2 fig.

Descriptors: *Waste water treatment, *Activated sludge, *Water temperature, *Biological treatment, Organic matter, Municipal water, Biochemical oxygen demand, Nitrification, Municipal waste, *Oxidation.

The influence of temperature, activated sludge concentration, and retention time on the biological oxidation of organic matter in urban waste water was studied. The BOD5 values decreased with increasing temperature in the temperature range of 10 to 20 C. The rate of nitrification was a function of the temperature, the hold time, and the activated sludge concentration. At an activated sludge concentration of 4700 to 6000 ppm, a retention time of 3 to 4 hours was required at 18 C. At an activated sludge concentration greater than 6000 ppm, the reaction time must be 4 hours and the temperature 15 C. With the activated sludge concentration under 6000 ppm, the reaction time must be increased accordingly. Diagrams for the determination and coordination of the activated sludge concentration, temperature, and retention time for a given residual BOD value or ammonium nitrogen content are presented. **PHOSPHATE PRECIPITATION IN ACTIVATED SLUDGE PLANTS WITH SLUDGE STABILIZATION AND DENTRIFICATION (PHOSPATFAELLUNG IN BELEBUNGSANLAGEN MIT SCHLAMMSTABILISATION UND DENITRIFIKATIONSSTUFE),**
K. H. Kienzle.
Vom Wasser, Vol 42, p 329-369, 1974. 16 fig, 9 tab, 14 ref.

Descriptors: *Activated sludge, *Waste water treatment, Phosphates, Nitrogen, Alum, Efficiency, Precipitation(Chemical), Biochemical oxygen demand, Facilities, *Denitrification, Oxidation.

Activated sludge plants with sludge stabilization were studied both in laboratory scale plants and in a full scale oxidation ditch. The study investigated the influence of precipitation of phosphate on both the purification effect and the nitrogen elimination efficiency. Phosphate elimination due to adding ferrous (III) chloride was not sufficient. The precipitant caused a lowered pH value in the plants and negatively influenced the activated sludge. Thus, the purification efficiency of the plants decreased, particularly regarding BOD5 degradation and nitrogen elimination. With alum precipitation, the efficiency was over 90% with effluent concentrations of less than one mg total phosphorus per liter. In this case BOD5 and nitrogen elimination were not negatively influenced. A low nutrient content in the effluent of activated sludge plants with sludge stabilization and a pre-step denitrification may be obtained by the simultaneous addition of aluminum for phosphate precipitation. **EXPERIENCE OF THE RUHRVERBAND WITH THE TREATMENT OF SEWAGE SLUDGE (ERFAHRUNGEN DES RUHRVERBANDES BEI DER KLAERSCHLAMMBEHANDLUNG),**
R. Imhoff.
Gas-und Wasserfach-Wasser/Abwasser, Vol 116, No 5, p 216-221, May, 1975. 6 fig, 3 tab, 6 ref.

Descriptors: *Sewage treatment, *Sludge disposal, Waste treatment, *Waste water treatment, Waste disposal, Dewatering, Aerobic treatment, Sludge treatment, Activated sludge, Stabilization, *Treatment facilities.
Identifiers: Composting, Ashing, Germany.

Sewage sludges must be stabilized prior to disposal. This can be achieved by rotting, aerobic stabilization, composting, or ashing. The Ruhrverband in the Federal Republic of Germany operates 115 small water purification plants; on the average only 33,000 residents are served per plant. For these systems, primarily digestion tanks are used. Nine plants with population equivalents of less than 10,00 are operated according to the activated sludge method with aerobic sludge stabilization. The first plant in that area using sludge ashing preceding dewatering was recently put into operation. It serves a population of 300,000. Since natural sludge disposal will increasingly become more difficult for larger plants serving a population of 300,000 to 500,000 four more sludge ashing plants will go into operation shortly. Since sludge incineration is two or three times as expensive as digestion tanks, incinerators for this purpose will be built only if no other method can be applied. (Nave-FIRL)

**PLANNING AND CONSTRUCTION OF SLUDGE TREATMENT PLANTS (PLANUNG UND BAU VON SCHLAMMBEHANDLUNGSANLAGEN),**
W. Vater.
Technische Mitteilungen, Vol 68, No 5, p 181-18
May, 1975. 6 fig, 36 ref.

Descriptors: *Sludge treatment, *Waste disposal, *Sludge disposal, Legislation, *Waste water treatment, Water reuse, Incineration, Stabilization, Construction, Planning, *Treatment facilities.
Identifiers: Germany, Composting.

Treatment of sludge from communal waste water is planned to either convert the sludge into a useful form such as fertilizer or to complete hazard-free disposal. At the planning stage of such facilities the Federal Waste Disposal Act (Germany), the Water Act and the Technical Directives for the Conservation of Clean Air (TA-Luft) must be taken into consideration. The advice of specialists is recommended. Any recycling or disposal of sewage sludges must be preceded by a stabilization process such as aerobic, anaerobic, aerobic-thermophilic stabilization, or by pasteurization, irradiation, or composting. Existing sludge disposal methods including composting, thermal drying and incineration are reviewed. (Nave-FIRL)

**MESTIC SEWAGE TREATMENT BY UN-DRAINED FILTER SYSTEMS,**
rio Ministry of the Environment, Toronto. ution Control Branch.
. Chowdhry.
ication No 53, December, 1974. 93 p, 37 tab, f, 3 append.

criptors: *Waste water treatment, *Filtration, tic tanks, Tile drains, Phosphorus, Ammonia, hemical oxygen demand, Suspended solids, rms, *Sewage treatment, *Filters.

Identifiers: Underdrained sand filters, Red mud.

Tests conducted for 3 1/2 years demonstrated the effectiveness of underdrained sand filters as alternatives to conventional tile fields for treating septic tank effluent. The commonly available sands from gravel pits used as the filter media ranged from 0.15 mm to 2.50 mm effective size and 1.0 to 4.5 uniformity coefficient. The filter beds produced effluents with BOD5 equal to or less than 7.8 mg/liter and suspended solids equal to or less than 4.6 mg/liter. The efficiency of treatment was 96.5%. Phosphorus removal by the filter media without chemical additives was 26.3-36.2%. The filter bed containing red mud, a by-product of Bauxite purification containing oxides of calcium, aluminum, and iron, removed 72.5-88.9% of the phosphorus. A period of six months was required for the stabilization of nitrogeneous compounds and the satisfactory reduction in free ammonia. Fecal coliforms were not totally removed but were considerably reduced when compared to septic tank effluent. (Orr-FIRL)

**AN INTEGRATED POWER PROCESS MODEL OF WATER USE AND WASTE WATER TREATMENT IN CHLOR-ALKALI PRODUCTION,**
Houston Univ., Tex. Dept. of Quantitative Management Science.
F. D. Singleton, Jr., J. A. Calloway, and R. G. Thompson.
Water Resources Research, Vol 11, No 4, p 515-525, August 1975. 11 fig, 4 tab, 22 ref.

Descriptors: *Water pollution control, *Standards, *Effluents, *Waste water treatment, *Linear programming, Economics, *Evaluation, Chemical industry, Chlorine, Alkalis(Bases), Effects, Costs, Treatment facilities, Optimization, Design, Solid wastes, Waste disposal, Technology, Water policy, Marginal costs, *Water utilization, Operations research, Mathematical models, Equations, *Waste water treatment.
Identifiers: Water withdrawal, Cost minimization, Power process model.

Described is an economic evaluation of the effects of increasingly restrictive waste water effluent standards and higher costs of water withdrawals on resource use, solid waste discharges, production costs, effluent taxes, and water use in chlorine and caustic production. A large-capacity diaphragm cell process, a small mercury process, and a combination of these production methods (for plant expansion) are studied for large modern plants at the design stage. A linear programming model provides an analytical description of a chlor-alkali plant at the design stage and determines the least -cost combination of processes. Model solution (1) identifies an optimal process configuration consisting of the production facility, waste treatment plant, and process energy system which satisfies all constraints and resource limitations pertinent to the problem, (2) gives minimum-cost levels of operation for each production and treatment process, (3) indicates the marginal costs of any resource or effluent restrictions, and (4) gives the total optimal cost of chlor-alkali production, water use, and waste water treatment. The model describes the three alternative methods for producing chlor-alkali products. According to results, zero discharges of total solids in diaphragm cell plants increased production costs 5.6%; zero discharges of total solids in mercury cell plants increased production cost 12.1%. Zero-discharge restrictions of mercury may only be accomplished by use of diaphragm cells. Similar results were obtained for assumed Houston and Saginaw locations. (Bell-Cornell)

**WATER RESOURCES PLANNING IN URBAN AREAS,**
Office of the Chief of Engineers (Army), Washington, D.C. Urban Studies Branch.
R. L. Fulton.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 101, No HY9, Proceedings paper No. 11571, p 1249-1255, September 1975. 1 ref.

Descriptors: *Water resources, *Planning, *Water pollution, *Sewage treatment, Legislation, State jurisdiction, Federal jurisdiction, Alternative planning, Projects, *Waste water treatment.
Identifiers: *Urban areas.

Congress authorized the U.S. Army Corps of Engineers to initiate an Urban Studies Program late in fiscal year 1972. This program provides a planning service conducted in coordination with local and state officials to address water resources problems in urban areas. The objective is to formulate alternative plans for solving the water resource problems which will aid in the solving of other urban problems. These studies, which take three to four years to complete, provide a General planning service with strong public involvement and participation by state and local interests and other Federal agencies. Traditional Corps projects resulting from the plans will be recommended to Congress for construction; wastewater treatment components will meet appropriate requirements of the Federal Water Pollution Control Act of 1972 and be utilized by local interests in applying for construction grants administered by the EPA. (Bell-Cornell)

**A DESIGN AND ECONOMIC EVALUATION OF WET-AIR AND CATALYTIC OXIDATION OF SEWAGE SLUDGE,**
Delaware Univ., Newark. Dept. of Chemical Engineering.
A. G. Fishbeck.
Available from the National Technical Information Service, Springfield, Va. 22161, as PB-235 266, $4.25 in paper copy, $2.25 in microfiche. May 1974. 54 p, 16 fig, 6 tab, 19 ref, append. OWRT A-014-DEL(9).

Descriptors: *Sludge treatment, *Sludge disposal, Activated sludge, Organic wastes, Yeast, Kinetics, Costs, *Oxidation.
Identifiers: *Wet air catalytic oxidation, Solubilization kinetics.

A modification of the wet air oxidation process developed by Zimpro Incorporated is proposed. The wet air oxidation reactor is redesigned to solubilize 99% of the organic solids at a lower pressure and temperature. The resulting organic rich solution will then be passed through a heterogeneous catalytic reactor in which the organic compounds will be completely oxidized. The experimental determination of solubilization kinetics for sludge solids was performed using yeast as the sludge model because of its similarity to sludge and ease of handling. The solubilization of yeast was found to involve both rapid oxidation and slower hydrolysis reactions which followed first order kinetics in solids concentration. The rate became oxygen mass-transfer limited after the oxygen initially dissolved in the solution was consumed. The wet air catalytic oxidation process was economically similar to a typical wet air oxidation process, $4.10/ton solids processed and $3.87/ton, respectively. The wet air catalytic process achieves 99% removal of total organic carbon while the wet air oxidation process achieves only 60-70% removal and requires more severe conditions. The final products of a wet air catalytic oxidation of sludge are sanitary, easily disposed of, do not require recycle, and are essentially pollution free. Future experiments in solubilization kinetics should be performed using activated sludge instead of yeast as the solid. (Orr-FIRL)

**THICKENING OF UNWANTED SPENT LIME REJECTS,**
D. R. Christensen, and R. W. Prettyman.
Water and Sewage Works, Vol 122, No 5, p 102-104, May, 1975. 6 fig, 2 tab, 3 ref.

Descriptors: *Waste water treatment, *Centrifugation, *Lime, *Sludge treatment, Dewatering, Design criteria, Treatment facilities, Maryland.
Identifiers: *Sludge thickening, Montgomery County(Md).

The Montgomery County Regional advanced waste treatment plant in Maryland is planning to treat its lime sludge by separating the unwanted materials (rejects) from the spent lime by centrifugation. The spent lime can be reused following recalcination. The rejects will be further settled in gravity thickeners before being pumped to dewatering equipment prior to final disposal. An investigation was conducted to obtain design data for the gravity thickening units. The tests were conducted with rejects from a centrifuge at the South Lake Tahoe advanced waste treatment plant in California. Rejects from the centrifuge are expected to enter the thickeners at 3% solids. A 24 hr detention time in a 6 ft depth at 4% solids should result in a solids loading rate of 15 lb/sf/day. Two 90 ft diameter rejects thickeners with a 10 ft side water depth are the preliminary design recommendations. This design will produce solids loading at a maximum flow of 16 lb/sf/day. (Orr-FIRL)

**THE INFLUENCE OF PARTICLE SIZE ON OXIDATION OF TOTAL, SOLUBLE, AND PARTICULATE MUNICIPAL WASTEWATER COMPONENTS BY OZONE,**
Southern Methodist Univ., Dallas, Tex.
J. J. McCarthy.
Available from University Microfilms Inc., Ann Arbor, Mich., 48106, Order No 75-11,452. PhD Thesis, 1974. 153 p.

Descriptors: *Waste water treatment, *Ozone, *Oxidation, *Municipal wastes, Solids, Oxygen demand.
Identifiers: Waste water fraction, Particulate matter.

Experimental data using ozone as a waste water treatment oxidizing agent are presented. Municipal waste water containing varying sizes of solids was ozonated in a quiescent settling column and an ozone contact chamber. The effect of ozone oxidation on particular waste water parameters was measured. Samples were separated into soluble and particulate fractions and the effects of ozone on each fraction were analyzed. Ozone tended to oxidize the particulate more than the soluble waste water fraction. The oxidation of the soluble waste water fraction is dependent upon the solids content of the waste water. With respect to waste water solids content and ozone consumption, the limitations of ozone in removing organic carbon, in acting as a disinfectant, and in satisfying oxygen demand were demonstrated. Solid particle size and distribution with increased settling time and ozone consumption were also discussed. (Prague-FIRL)

**FINAL DISPOSAL OF MUNICIPAL SLUDGE IN SWEDEN,**
National Swedish Environment Protection Board, Stockholm. Research Lab.
V. Tullander.
Journal Water Pollution Control Federation, Vol 47, No 4, p 688-695, April, 1975. 2 fig, 1 tab, 1 ref.

Descriptors: *Legislation, *Ultimate disposal, Municipal wastes, Waste disposal, Treatment facilities, Waste water treatment, Sludge disposal, Landfills, Storage, Fertilizers.
Identifiers: *Sweden, *Sludge handling, Agricultural disposal.

A summary is presented of the most recent legislation from the National Swedish Environmental Protection Board on final disposal of municipal sludge in that country. The responsibility for municipal sludge disposal is seen as resting with the individual waste water treatment plant manager. Sludge handling for final disposal is dependent upon the sludge quality, preliminary treatment, and available local disposal methods. The types of disposal recommended are deposition either at sludge disposal sites or at landfill, or deposition for soil enrichment and agricultural use. Methods such as drying, incineration, or composting, are considered to intermediate rather than ultimate disposal steps. Choice of storage site should be based on the assessment of ground conditions. Factors to be considered in developing a disposal system include the diversion of rain and surface water, the building of dike walls around the disposal site, the collection and disposal of sludge runoff, and the continued inspection of sites, with appropriate safety measures to be taken. Sludge for agricultural use may require a short term, intermediate storage site, which should be located where no leaching and subsequent pollution of local water supplies might occur. Digested sludge as a fertilizer must meet Swedish standards such as metal content and must be continuously controlled as to effluent quality and frequency of application. (Prague-FIRL)

DISPOSAL OF CHEMICAL SEWAGE SLUDGES ON LAND AND THEIR EFFECTS ON PLANTS, LEACHATE AND SOIL SYSTEMS,
Environmental Protection Service, Burlington (Ontario). Waste Water Technology Center.
P. K. Chawla, D. N. Bryant, and D. Liu.
In: Sludge Handling and Disposal Seminar, Conference Proceedings No 2, September 18-19, 1974, Toronto, Ontario, Canada, p 207-233, (1974). 8 fig, 1 tab, 14 ref.

Descriptors: *Sewage sludge, *Environmental effects, Land, Soils, Fertilizers, Plant growth, Leachate, Nitrogen, Phosphorus, Potassium, Nickel, Copper, Zinc, Aluminum, Groundwater, Canada, *Sludge disposal, *Waste disposal.
Identifiers: Sludge-soil-plant system, Petroleum hydrocarbons.

In 1972 an extensive lysimeter study was undertaken at the Wastewater Technology Centre, Burlington, Ontario, to determine the long-term environmental effects of chemical sewage sludges on land. The soils were silt loam and loamy sand. The sludges were anaerobic digested lime treated sludge, and ferric chloride treated sludge. A commercial fertilizer was also used. Plants and leachates were collected and analyzed. The rate of sludge application determined the yield of the dry matter. With a high rate of iron and lime sludges on loamy sand, the yields were comparable to fertilizer. On silt loam the yields were higher than with the fertilizer addition. On both soils, alum sludge gave lower yields than iron sludge, lime sludge, or fertilizer. Plant growth retardation could occur from the low potassium, high zinc and aluminum content of the alum sludge. High concentrations of petroluem hydrocarbons in the alum sludge also caused some plant toxicity. The nitrogen, phosphorus, potassium, nickel, copper, and zinc concentrations in the plants related to the amount of sludge applied. The nitrogen level in the leachate did not pose a potential hazard to groundwater. During the one-year study period no apparent chemical changes in the soil were observed. WATER PROCESSING PLANT TO CONTROLLED ACIDITY LEVEL,
K. G. Zeidel.
U.S.S.R. Patent SU 420569. Issued March 25, 1975. Derwent Soviet Patents Report, Vol W, No 7, p 1, March 1975. 1 fig.

Descriptors: *Acidity, *Patents, *Water treatment, *Treatment facilities, *Control, Equipment, Measurement, Pipelines, Design, Waste water treatment.
Identifiers: *Water processing plant.

A water processing plant to control acidity level which utilizes the addition of a reagent maintaining the pH difference between treated and untreated water was patented. This water treatment plant consists of a bifurcated pipeline, in which a branch is adapted for injection of acid from a tank through its corresponding needle valve. Alkalinity and acidity of water in two branches are measured by detectors, connected to an electronic regulator and programmer. Signals are applied to a reversible regulator, acting through a servomotor on a valve. The design provides a stable value of the residual alkalinity of water in the outlet pipe. (Prague-FIRL)

APPARATUS FOR CLEANING LOOSE FILTERING MATERIAL IN SLOW WATER FILLED WATER SUPPLY FILTERS,
B. F. Volokh.
Canadian Patent 957, 288. Issued November 5, 1974. Patent Office Record, Vol 102, No 45, p 38, November, 1974.

Descriptors: *Patents, *Filters, *Water supply, Cleaning, Equipment, Filtration, Water treatment, Waste water treatment.
Identifiers: Washing, Filtering material, Water supply filters.

Equipment was patented for cleaning loose filtering material in slow water-filled water supply filters. The apparatus consists of: a washing chamber with an open bottom, placed upon the surface of a layer of filtering material to be cleaned in a water-filled filter; means for moving this washing chamber relative to the filtering material to be cleaned. A suction pipe evacuates dirty water from the washing chamber. The washing tubes and suction pipe are installed within the washing chamber. Means regulate the degree of buoyancy of the washing chamber which is afloat in the filter, by regulating the pressure of the washing chamber upon the surface of the filtering material layer. **IRON AND MANGANESE REMOVAL WITH OZONE, PART I,**
R. R. Furgason, and R. O. Day.
Water and Sewage Works, Vol 122, No 6, p 42, 45-47, June, 1975. 2 fig.

Descriptors: *Water treatment, *Ozone, Potable water, *Iron, *Manganese, Ion exchange, Filtration, Idaho, *Oxidation.
Identifiers: Sequestering, Chemical oxidation, Gravity filtration, Pressure filtration, Contact filtration, Manganese greensand, Moscow(Ida).

A water treatment demonstration program performed in the Moscow, Idaho, municipal water system showed that ozone can be used to effectively and economically oxidize iron and manganese to an insoluble form that can be removed by filtration. The water supply of Moscow is supplemented at times of peak demand by several wells containing water with a high iron and manganese content. The high costs of developing new wells which would provide a higher quality water have prompted research into methods of iron and manganese removal. In addition to the tests on ozone treatment, ion exchange, sequestering, chemical oxidation and gravity filtration, chemical oxidation and pressure filtration, and contact filtration/manganese greensand processes were examined. Ion exchange was found to be unsatisfactory because of the high operating and maintenance costs and the high sodium residual introduced into the water. Sequestering would be an economical process but has problems connected with its operation such as a chance of exceeding the maximum phosphate level, the heating effect could render the sequestering agent unusable, the need for pH adjustment, and the doubt as to the ability of this method to remove manganese. Gravity filtration is unacceptable because of the high operational and maintenance costs and also the danger of high sodium residual levels. Pressure filtration is an economical and effective way to remove iron but to also remove manganese significantly increases the cost of this method. The costs of contact filtration substantially exceed those of pressure filtration, but this process will remove the manganese along with the iron. (Orr-FIRL)

**INNOVATIVE WATER PLANT SLATED FOR NEW JERSEY,**
Havens and Emerson Ltd., East Paterson, N.J.
P. W. Doe, and W. R. Inhoffer.
Water and Wastes Engineering, Vol 12, No 4, p 30-32, 66, April, 1975. 1 fig.

Descriptors: *Treatment facilities, *Water treatment, *Waste water treatment, Sludge disposal, Planning, Investigations, Automation, Dewatering, *New Jersey
Identifiers: Passaic Valley(NJ), Filter backwash water, Alum sludge.

The Passaic Valley Water Commission's major treatment plant is located at Little Falls, New Jersey on the Passaic River and serves Paterson, Passaic, Clifton and eleven other north New Jersey communities. Improvements taking place at this plant will provide an innovative water treatment project which is one of the first in the country to include a comprehensive filter backwash water and alum sludge disposal scheme. These improvements are expected to be completed in the near future. Extensive investigation both on-site and in the laboratory into dewatering, off-site disposal, and on-site disposal went into the plans for this project. Four pumping stations, a chemical dosing system, a backwash water settling tank, a sludge thickening complex, and a sludge press house will make up the backwash water and sludge disposal facilities. Overflows have been provide in case of emergency. Some phases of the process will be completely automated. (DEAN-FIRL)

**SEA WATER SOFTENING WITH THE LIME-MAGNESIUM CARBONATE (LMC) PROCESS,**
Burns and Roe Construction Corp., Fountain Valley, Calif.
J. D. Mavis, and A. Checkovich.
Industrial and Engineering Chemistry, Process Design and Development, Vol 14, No 3, p 204-209, 1975. 4 fig, 3 tab, 10 ref.

Descriptors: *Sea water, *Water softening, Pilot plants, Distillation, Desalination, Evaporators, Lime, Water treatment, Magnesium carbonate.
Identifiers: *Lime-magnesium carbonate process, Calcining, Magnesium hydroxide production, Magnesium hydroxide carbination.

A pilot plant to remove 70% of the calcium from sea water using the lime-magnesium carbonate (LMC) process was tested and improved. The advantages of the LMC process are that it does not depend on the sale of byproducts for its economic use, and all materials produced in the process are recycled for use in some other part of the process. Nominal chemical makeup is required. The two feedstocks required are limestone and fuel oil - all other materials in the process are derived from these. The four basic operations involved are softening, calcining, magnesium hydroxide production, and magnesium hydroxide carbonation. A prototype LMC plant was operated at the San Diego Test Facility by the Office of Saline Water, Department of the Interior. The utility of the LMC process as a pre-treatment for high temperature distillation desalting plants was demonstrated. The Test Facility experiments confirmed that an evaporator can be operated at a maximum brine temperature of at least 335 F, and that an LMC plant could be designed to have a high on-stream factor. The LMC pre-treatment is estimated to cost 5.1 cents per 1000 gallons of treated water for a plant sized to supply a 50 mgd desalting plant. The process may be useful with desalting processes using feed water more saline than the oceans. (Murphy-FIRL)
W75-11699

**UPRATING AND REDESIGN OF WATER TREATMENT PLANTS, PART II,**
E. O. LaFontaine.
Water and Sewage Works, Vol 122, No 5, p 96-97, May, 1975. 1 fig.

Descriptors: *Water treatment, *Treatment facilities, *Water supply, Filters, Pumps, Automatic control, Water demand, Pipes, Valves.

Advanced engineering technology can be used to uprate many water plants to provide greatly increased output. Increased output can often be effected through the use of new and better chemicals together with improved operating techniques without the need for physical disruption of the plant or new construction. Pressure filters and gravity filters may be uprated with properly designed pre-treatment facilities and chemical application. Filters may be rebuilt and uprated at a relatively modest cost. When rebuilding filters it may be desirable to replace the filter bottoms or under drain systems. The backwash system generally does not have to be rebuilt to perform satisfactorily with a rebuilt filter if it has performed well in the past. The installation of improved jet wash or air scouring equipment should be considered in an uprating program. Proper automatic control over the application of chemicals, rate of flow, filter operation, pump operation and emergency facilities will improve plant efficiency and insure a higher plant capacity. Uprating a plant will mean an increase in water which in turn may necessitate installation of new pipes, valves, and high lift pumps. A diesel generator set for standby power provides a significant improvement in operational efficiency under emergency conditions. A large clear water storage facility will also increase the capacity by providing the capability for operation under various load conditions. (Orr-FIRL)

**COUNTY COMBATS URBAN STORM WATER RUNOFF PROBLEMS,**
Mecklenburg County, Engineer's Office, Charlotte, N.C.
E. K. Hoffman.
Public Works, Vol 106, No 5, p 92-93, May, 1975.

Descriptors: *Water management(Applied), *Storm runoff, *Urbanization, Flood control, Flood plains, Streams, Drainage, Storm water, *North Carolina.
Identifiers: Sediment control.

Storm water management is being planned in Mecklenburg County, North Carolina, after a study of the effects of urbanization on storm runoff. It was found that an increase in the amount of runoff caused by urbanized impervious areas, coupled with a reduction in lag time, increases peak discharges up to 2 1/2 times, and causes an increased frequency and extent of downstream flooding. To prevent further encroachment on the existing floodplain, a floodway ordinance was passed, restricting development along any stream with a drainage area of at least one square mile. A five-year drainage capital improvement program has also been developed for stream bank sloping and stabilization and for the control of channel widening. In addition, the planning includes erosion and sediment control to minimize stream degradation. (Prague-FIRL)

**AN EQUITABLE SEWER USE CHARGE SYSTEM,**
Gilbert Associates, Inc., Reading, Pa.
P. A. Podolick.
Public Works, Vol 106, No 5, p 91, 95, 136A, May, 1975. 1 tab.

Descriptors: *Federal Water Pollution Control Act, Costs, Sewers, Treatment facilities, Waste disposal, Biochemical oxygen demand, Suspended solids, *Pollution taxes(Charges).
Identifiers: *Sewer use charges, Sewer rent, Effluent quality, Unit treatment costs.

a result of the Federal Water Pollution Control
t Amendments of 1972, equitable sewer use
arge systems are being developed and imple-
nted. Traditional sewer rentals or charges were
sed on an 'economy of scale', whereby the more
ic feet of waste water a particular user
charged, the less per cubic foot he would pay.
e PL 92-500 guidelines stipulate that all
ipients of Federal funds must pay a base charge
proportion to their contribution to the total
ste water loading of their treatment works. In
ition to the base charge, an industrial waste
charge will be applied to all users who
charge waste water with concentrations of
D, suspended solids, and/or dissolved solids in
ess of those of normal domestic sewage. The
e user charge assumes that domestic users
charge waste water with similar characteristics,
is determined by computing the total opera-
al and maintenance costs for the previous year
dividing this figure by the total volume of
ste water treated that year, to yield a charge in
lars per cubic foot of waste water discharged.
non-domestic wastes, an industrial surcharge
ased on the preliminary determination of actual
t of treatment on a unit cost basis for BOD,
pended solids, and dissolved solids. A formula
quarterly surcharge is then implemented, in-
ving unit treatment costs and waste loadings for
h parameter as applied to an individual system.
formula must be updated each year by deter-
ation of current unit treatment costs. (Prague-

n control, *Oil wastes, *Oil-water interfaces,
ents, *Separation techniques, Water pollution
ces, Oil spills, Oil pollution, *Skimming.
tifiers: *Oil-water separation.

ethod for the control of water pollution by oily
lucts has been patented. The method involves
ing a paste of the oily products, which then
s on the surface of the water and is removed
kimming. The first step of the method is the
aration of a product comprising a chromium
plex anchored to solid particles of a metallic
inosilicate. The chromium comples is coor-
ted to an acyclic carboxylic acid having at
seven carbon atoms, by contacting about 5-20
s by weight of solid particles of an aluminosil-
e of less than 100 micron average particle size
one part by weight of an aqueous alcoholic
tion containing from about 20-30% by weight
ne coordinated chromium complex. The mix-
is then heated to dryness at a temperature of
200 C. One to four parts by weight of the dried
luct are distributed over one part by weight of
oily product floating on the surface of the
r. The oily product then forms a paste floating
he surface of the water. The last step is to
ve the paste from the surface of the water by
ming. (Orr-FIRL)

**APPARATUS FOR SEWER TREATMENT TO KILL THREE ROOTS AND OTHER ORGANIC GROWTH THEREWITHIN,**
Airrigation Engineering Co., Inc. Carmel Valley, Calif. (assignee).
F. F. Horne.
United States Patent 3,880,176. Issued April 29, 1975. Official Gazette of the United States Patent Office, Vol 933, No 5, p 2038, April, 1975. 1 fig.

Descriptors: *Patents, *Sewerage, *Pipes, Organic compounds, Phytotoxicity, Liquid wastes, Pressure.

Root-infested sewer pipes may be treated with a newly patented apparatus. Its parts consist of: a sled with a low center of gravity having a bottom skid for engaging only the lower portion of a pipe; means for pulling the sled through a pipe; and, upwardly facing spray means for producing a diffuse and foam-inducing spray. The sled is open at its upper end and the spray means are mounted on the sled so that they can direct spray against the upper walls of the pipe. An aqueous mixture of liquid phytocidal fumigant and surfactant is thus sprayed under pressure to the upper portions of the sewer pipe so that undesired organic growths are eliminated. (Prague-FIRL)

**DISPOSAL OF SANDY PIPELINE DREDGE SPOILS BY END DUMPING,**
Oregon State Univ., Corvallis. Dept. of Civil Engineering.
W. L. Schroeder, and M. R. Pyles.
In: Proceedings, ASCE National Structural Engineering Convention, April 14-18, 1975, New Orleans. Reprint no. ORESU-R-75-004. 18 p, 13 fig, 1 tab, 6 ref.

Descriptors: *Dredging, Excavation, Mathematical models, Channel improvement, Disposal, *Waste disposal.
Identifiers: *Dredge spoiling, *End dumping, Ambient velocity patterns, Induced velocities, Settling velocity, *Pipeline dredge spoils, Channel maintenance, Open water disposal.

It has been shown that it is possible to predict, within limits, the fate of sandy spoils discharged from a pipeline dredge in water. The means of making these predictions is based on a simple representation of the actual physical conditions at the end of the pipeline. More refined predictions are possible if physical conditions can be more completely characterized. In light of the nature of a real spoiling operation, and the possibility of more closely controlling spoil dispersion therefrom, it is unlikely that further refinements are warranted. A model based on settling velocities and average currents in the receiving body, coupled with an empirical representation of the effects of the pipeline jet, appears to be satisfactory. (NOAA)

**THE CASCO BAY OIL SPILL: PROBLEMS OF CLEANUP AND DISPOSAL,**
Environmental Protection Agency, Boston, Mass. Div. of Surveillance and Analysis.
C. L. Eidam, E. V. Fitzpatrick, and J. F. Conlon.
In: 1975 Conference on Prevention and Control of Oil Pollution Proceedings; American Petroleum Institute, EPA, and U.S. Coast Guard; p 217-221, March 1975. 8 fig, 4 ref.

Descriptors: *Oil pollution, Sources, *Oil spills, Treatment, *Methodology, *Sands, *Commercial shellfish, Water quality, Survival, Lobsters, Intertidal areas, Burning, Disposal, Environmental effects, *Maine.
Identifiers: *Seaweeds, *Cleanup techniques, Follow-up studies, Recolonization, Casco Bay(Maine).

The control and cleanup of a 422,000 liter no. 6 fuel oil spill which occurred in Casco Bay, Maine, on July 22, 1972, were discussed. A lack of locally available equipment, transportation, and the disposal of large amounts of oil-soaked debris presented unique problems. The development of priorities for cleanup proved critical because of commercial harvests of shellfish, lobsters, and intertidal seaweed, and recreational interests. The disposal of 7,646m to the 3rd power of oil-soaked seaweed and 3,440 m to the 3rd power of contaminated beach sand was a major obstacle. The damage resulting from the spill and the effectiveness of the cleanup were studied up to one year after the spill. The studies indicated that the cleanup techniques used resulted in more successful survival and/or recolonization of intertidal populations than in areas not cleaned. (Katz)

**REHABILITATING OILED AQUATIC BIRDS,**
International Bird Rescue Research Center, Berkeley, Calif.
D. C. Smith.
In: 1975 Conference on Prevention and Control of Oil Pollution Proceedings; American Petroleum Institute and U.S. Coast Guard; p 241-247, March 1975. 1 tab, 3 append, 84 ref.

Descriptors: *Aquatic animals, *Oil pollution, *Oil spills, *Birds, *Animal physiology, Treatment, Economics, Cleaning, History, Population, Environmental effects, Mortality, Research and development, Detergents.
Identifiers: *Rehabilitation, *Aquatic birds.

In the 1971 San Francisco oil spill, $900.00 was spent per successfully released bird, with 95% of the 4,686 treated birds dying in captivity. Through continuing research and development, those figures are improving. In 1973, the International Bird Rescue Research Center treated 523 oiled birds with a 41% survival rate at a cost of approximately $15 per successfully released bird. The history, population effects, and physiological effects of oil pollution on birds were described, and recommendations were given for treatment. The problems of maintaining aquatic birds in captivity were also discussed. Advance preparations of instructional materials, equipment, and supplies have been made in anticipation of future oiled-bird incidents. Additional research was indicated. (Katz)

**REVISION OF THE REGULATIONS 'PLANNING OF SANITARY PROTECTION ZONES OF A CENTRAL WATER SUPPLY SYSTEM AND WATER SOURCES' (IN RUSSIAN),**
Moskovskii Gosudarstvennyi Meditsinskii Institut (I) (USSR)
S. N. Cherkinskii, and N. N. Trakhtman.
Gig Sanit, Vol 38, No 11, p 89-92. 1973.

Descriptors: Potable water, *Water quality control, *Regulation surface waters, Water pollution sources, *Water quality standards, *Water zoning, Water treatment, Bacteria.
Identifiers: Contamination, *USSR

When revising the regulations on the planning of sanitary protection zones, the existing bacterial contamination of surface water sources, the known limitations of water treatment at water works, and the dependence of the end result of water treatment and decontamination on its initial quality must be considered. These factors necessitate the creation of sanitary protection zones of central drinking water systems to limit contamination of the water by bacteria, viruses and organic matter from domestic and industrial sewage. The boundaries of the protection zones of surface water sources should be based on the rate of bacterial self-purification and the climatic zone.--Copyright 1975, Biological Abstracts, Inc

**ON TAXATION AND FIRMS CHOICE OF WASTE WATER TREATMENT TECHNOLOGY,**
Technical Univ. of Denmark, Lyngby.
M. Bundgaard-Nielsen, and C. L. Hwang.
Water Resources Bulletin, Vol 11, No 4, p 805-810, August 1975. 3 fig, 22 ref.

Descriptors: *Water quality control, *Waste water treatment, Technology, *Taxes, Effluents, *Pollution abatement, Management, Linear programming, Optimization, Economic efficiency, Equations, Systems analysis, *Pollution taxes(Charges).
Identifiers: Environmental quality, Consumer prices, Production costs, Waste discharge, Cost minimization.

In recent years, the use of effluent charges or taxation to abate pollution has been advocated extensively. A major argument in support of the taxation approaches is that they can achieve economic efficiency with minimum information requirements. Byrne and Spiro (1973) have demonstrated that taxation is a necessary condition but not a sufficient one for attainment of an efficient solution under certain circumstances when the firm has at its disposal a number of production processes where low levels of pollution require high capital input and vice versa. This paper extends the work of Byrne and SIRO AND PRESENTS A DISCUSSION of the interaction between the level of taxation and the firms accruing choice of treatment technology. Presented is a linear programming solution for the choice of least-cost waste treatment process. In conclusion, the interaction between available technology and enforcement strategy must be accounted for in order to prevent the use of taxation levels which fail to improve environmental quality yet tend to increase production costs and thus consumer prices. The possible inefficiency of a surcharge to abate pollution is similar to that of the taxation. (Bell-Cornell)

**HYGIENIC EVALUATION OF SPRING CAPPINGS USED ON THE SOUTHERN SHORE OF CRIMEA, (IN RUSSIAN),**
Yalta Sanitary-Epidemiology Station (USSR).
Y. E. Shapiro.
Gig Sanit, Vol 38, No 11, p 99-101. 1973.

Descriptors: *Water quality control, *Spring waters, Water sources, Potable water, Public health.
Identifiers: *Cappings, *USSR(Crimea).

A study of the structures for collecting spring water used on the water mains of Crimea (USSR) showed that hygienic requirements are met only by spring cappings of the Smolskii type which ha upland drainage ditches, puddle trenches of well crumbled and tamped fat clay, a side entrance door and a settling basin serving as the water-collecting chamber. The construction of these cappings helps to preserve the quality of spring water and their proper operation reduces the possibility of water pollution at the site of intake. Descriptors: *Computers, *Flood control, Hydrologic aspects, Reservoirs, Economics, *Cost-benefit analysis, Simulation, Flood protection.
Identifiers: West Germany.

Computerized cost-benefit analysis as a basis for the dimensioning of flood protection measures involving 40 retention reservoirs in the Aller-Leine-Oker-Planes area, covering 16,000 sq km in West Germany, is discussed. The hydrological data are determined on the basis of simulation with respect to a limited number of flood events. The flood retention facilities will be designed for a probability of exceeding 0.02. The economic benefits of the flood control measures are calculated with respect to the potential damage areas classed as residential, industrial, commercial, farmlands, and forests. Averaged unit damages are assigned to each type of land use, taking into consideration the increase in landed property values as a result of flood protection. It is possible to determine the optimal sequence of the flood protection measures by the computer program. Flood retention reservoirs along the upper reaches of the recipients are most efficient even when they are more expensive than similar facilities along the lower reaches of the recipients. NATURAL AND ARTIFICIAL REEFS IN MISSISSIPPI COASTAL WATERS: SPORT FISHING PRESSURE AND ECONOMIC CONSIDERATIONS,
University of Southern Mississippi, Hattiesburg. Bureau of Business Research.
Donnie L. Daniel, and Joe E. Seward, Jr.
Report MASGP-75-007, Spring 1975. 27 p, 1 fig, 3 tab. OSG MASGP-75-007.

Descriptors: *Reefs, *Sport fishing, *Economic feasibility, Resources, Econometrics, Cost-benefit analysis, Fisheries, Economics, Data collections, Surveys, *Mississippi.
Identifiers: *Mississippi Sound, Economic analysis, Natural reefs, Artificial reefs.

This study represents the initial research effort in an attempt to assess the sport fishing pressure at existing artificial and natural reefs in the Mississippi Sound. Activities are already underway to develop new artificial fishing reefs in that area. Hopefully, this study will provide some useful input toward an efficient utilization of scarce resources for that purpose. The purpose of this project is twofold: (1) it provides estimates of the fishing pressure on various types of artificial and natural fishing reefs in the Mississippi Sound; and (2) it provides some economic guidelines which should prove useful in determining the feasibility of artificial reefs. The study also makes recommendations that are designed to help achieve the conditions necessary for the reef to be economically justified. (NOAA)

COASTAL RESOURCE USE: DECISIONS ON PUGET SOUND,
Washington Univ., Seattle.
R. L. Bish.
University of Washington Press Seattle, 1975, 217 p. OSG 1-35320, NG-1-72, and 04-3 158-42; NSF GH-40 and GH-66.

Descriptors: *Resources development, *Coasts, *Natural resources, Water utilization, Fisheries, Forestry, Boating, Economics, Political aspects, Geological formations, Urban sociology, Regional analysis, *Washington.
Identifiers: *Puget Sound(WA), *Coastal resources, Legal-political system, Shoreline Management Act of 1972.

Five scholars in economics, political science, geography, and urban affairs study Puget Sound for coastal resource use patterns, trends and conflicts, and the legal and political structures through which resource use decisions are made. The volume begins with a historical description of the Puget Sound region, including its geological formations, its resources, and their role in the region's development. These patterns are related to specific uses of Puget Sound's resources, from fisheries and forestry to pleasure boating and shoreline parks. Conflicts among different resource uses are analyzed, with four in-depth case studies illustrating the nature of the conflicts and how the legal-political system functions to revolve them. The origins, controversies, and predicted consequences of Washington's landmark Shoreline Management Act of 1972 are also analyzed. Of particular interest are the original aspects of this study: the systematic analysis of conflict resolution has been integrated with the nature of the resources involved, and the forecasts of uses and conflicts have been integrated with a political analysis. COOPERATION IN WATER RESOURCES PROGRAMS: ALASKA'S EXAMPLE,
Cold Regions Research and Engineering Lab., Fairbanks, Alaska.
C. W. Slaughter, T. G. Freeman, and G. L. Audsley.
Water Resources Bulletin, Vol 10, No 4, p 802-812, August 1974. 5 fig, 2 tab, 9 ref.

Descriptors: *Water resources development, *Alaska, *Programs, Coordination, Hydrology, Planning, River basins, Snow surveys, Networks, Assessment, Watersheds(Basins).
Identifiers: Flood warning.

Alaska possesses a diversity and magnitude of water resources unmatched in any other state. With over 15% of the total area of the United States and 40% of the nation's total fresh water supply, but with an extreme lack of basic hydrologic and climatologic data, cooperation among agencies and individuals concerned with evaluating, planning, and implementing water

resources programs is essential. Toward this end, the IntereAgency Technical Committee for Alaska (IATCA) was established under charter from the Water Resources Council. Representation in IATCA includes virtually all Federal, State, and Academic entities in Alaska having an interest in the water resources of the State. Existence of IATCA has permitted or facilitated numerous Alaskan water resources programs. Several are described briefly: a flood warning network in the Chena River basin; establishment of the Caribou-Poker Creeks Research Watershed in Central Alaska; preparation and periodic updating of the 'Ten-Year Plan for Water Resources Data Acquisition;' current planning for an integrated 'real-time reporting network' for hydrometeorological data within the State; and a framework for implementation of the Alaska phase of the National Water Resources Assessment, currently in the initial phases. Accomplishments to date testify that it is indeed possible to cooperate and amalgamate in the broad field of 'Water Resources' in the largest of our 50 states. (Bell-Cornell)

**PLANNING FOR RESOURCES-ENVIRONMENTAL CONSERVATION,**
R. F. Bessey.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 99, No HY11, Proceedings paper No 10173, p 2061-2078, November 1973. 40 ref.

Descriptors: *Water resources, Civil engineering, *Environmental engineering, *Conservation, *Management, *Natural resources, *Regional planning, *Comprehensive planning, River basins, Multiple-purpose, Cost-benefit ratio, Evaluation.
Identifiers: *Systems engineering, Drainage basins, Environmental quality.

The need is stressed for comprehensive, integrated, resources-environmental planning in our present era of mounting endangerment of the human environment. The focus is on background and trend in water, land, and related resources, and regional planning. The human purposes and consequences of goals, policies, plans, design, and programs in resources-environment fields are implicit. The present place and potential of civil engineering (inherently concerned with the problems of citizen and civilization) in this scene of environmental threat are substantial. The burgeoning requirement for environmental impact reviews substantially expands the need and opportunity for civil engineering participation. However, the overall philosophy and organization of comprehensive planning must be interdisciplinary, with application of the gamut of concerned physical, social, and administrative sciences and arts. Analysis includes general views of: (1) the evolutionary setting, with emphasis on conservation, river basins, and regions; (2) situation and directions of planning in the present era; (3) comprehensive planning requirements, purposes, and principles; (4) organizational arrangements; (5) global aspects; and (6) salient conclusions as to civil engineering directions and practices.

Wisconsin Univ., Milwaukee. Center for Great Lakes Studies.
M. Balfe, R. Heilmann, J. Johnson, and W. Wendling.
Special Report No 23, April 1975, 395 p.

Descriptors: *Great Lakes, *Great Lakes region, *Economics, Export, Import, Transportation, Foreign trade.
Identifiers: *Shipping, *Trade, *Commodity analysis, Port analysis, Trade routes, Chicago, Cleveland, Detroit, Duluth, Milwaukee, Toledo, Export movements, Import movements, Shipments.

This study is concerned with both a geographic and commodity-specific description of the hinterland of the Great Lakes. Using as a source report a sampling survey of export and import traffic entitled Domestic and International Transportation of U.S. Foreign Trade: 1970, issued by the Bureau of Census, the authors sought to obtain new data on the domestic leg of U.S. foreign trade and to link those with previously collected information on the international leg of 'linear-type' commodity flow. Detailed analyses constitute the bulk of the report, including specific analyses of 28 commodities and major Great Lakes ports. It is stressed that the source material was biased toward shipment weight for vessel movements and therefore the inadequacy of the sampling procedure should be taken into consideration before specific conclusions are to be drawn. Maryland Univ., College Park. Dept. of Civil Engineering.
R. H. McCuen, R. C. Sutherland, and J. R. Kim.
Journal of the American Water Works Association, Vol 65, No 5, p 239-244, May, 1975. 4 tab, 7 ref.

Descriptors: *Water demand, *Water distribution(Applied), *Water users, *Planning, *Forecasting, Elasticity of demand, Water requirements, Water supply, Consumptive use, Human population.
Identifiers: *Commercial establishments, Mall shops.

Water demand prediction equations are derive from a study of water use in four shopping center Commercial establishment water use has not bee extensively studied because it accounts for only 1 to 20% of total water demand and lacks the larg daily and seasonal peaks of industrial and re sidential use. But accurate demand predictions ar necessary where limits are placed on water an sewer hookups. Department stores with an without restaurants and 24 types of mall shop were analyzed. Geographic differences ar minimal because water is used primarily fo domestic-type uses: water for air conditioning wa not included in the study. Use depends on sta size and also the number of public facilities foun in large stores. A close linear relationship wa found using gross floor area as a proxy variab which is much easier to determine and more rea ly available. There is also significant variati between types of mall shops since some use wat in their business activities. Classification of sho by 4-digit S.I.C. (Standard Industrial Classific tion) code allows more accurate demand predi tions by shop type. Forecasting must also consid layout and design, transportation balance, lab productivity, and the common variables of regu tions and technological change. The inelastic d mand with respect to price in domestic-type wa use suggests that commercial use, which includ considerable lavatory use, will not respond signi cantly to changes in water price. TE REGULATION OF COASTAL WATER A PRESERVES,
ni Univ., Fla. School of Law.
atfield.
ct No. R/L-5, December 1974. 60 p. Project R/L-5.

riptors: *Water management(Applied), er conservation, *Water control, Coasts, water, Estuaries, Water rights, Marine fishe-Conservation, Water policy, River regula-*Regulation, *Preservation, Protection, State liction.

Identifiers: Coastal waters, Marine sanctuaries, *Estuarine sanctuaries, *Sanctuaries, State regulations, Coastal zones, Coastal regulations, Coastal management, State policies.

Each sanctuary should have a stated management program which would be consistent with both the goals of the particular sanctuary and with federal procedures. The program should clearly specify the controlling functions of the sanctuary, the means of accomplishing the stated purposes and the mechanisms for managing the sanctuary. Provisions should be made for the approval of projects and programs as well as for termination of them and for resolution of conflicts and for modifications of the uses of the sanctuary. Any proposed environmental modification in the vicinity of the sanctuary should be critically reviewed by responsible local, state and federal agencies and should be prohibited if it has an adverse effect on the sanctuaries. The boundaries of each sanctuary should be clearly marked and the region should be properly policed to insure that the guidelines governing sanctuary operations are not violated. (NOAA)

**THE MANAGEMENT OF LAND AND WATER USE IN THE COASTAL ZONE: A NEW LAW IS ENACTED IN NORTH CAROLINA,**
North Carolina Univ., Chapel Hill. School of Law.
T. J. Schoenbaum.
Reprint from The North Carolina Law Review, Vol 53, December 1974, No 2. University of North Carolina Sea Grant Reprint No 77, 30 p. OSG GH 103.

Descriptors: *North Carolina, *Water law, *Water policy, *Regulation, *Coasts, *Comprehensive planning, *Management, Legislation, Law enforcement, Legal aspects, Penalties(Legal), Water rights, Water, Zoning, Land use, Land development, Land management, Governments, Judicial decisions, Watershed management, Project planning.
Identifiers: *Coastal Area Management Act(CAMA) of 1974(NC), Federal Coastal Zone Management Act of 1972, Coastal zone management.

This article analyses and evaluates the Coastal Area Management Act of 1974, North Carolina in light of the Federal Coastal Zone Management Act of 1972 and other comprehensive state coastal zone management laws. It also describes the significant new legal processes instituted and discusses some of the new legal questions raised. The act itself was a first step toward the establishment of a comprehensive coastal land and water management program. No definitive judgment of its effectiveness can be made until after it is fully implemented. The author feels that even through the Act meets the minimum federal guidelines for a state coastal zone management program it contains serious flaws that may subvert its effective operation. These include the exclusively local character of the Coastal Resources Council, the lack of legal requirements to assure the implementation of the planning process, and the exemptions given to certain interest groups, especially agriculture and forestry. The author feels continuing empirical research on the law's operation and effectiveness are needed. (NOAA)

**ROLE OF COMPUTER SIMULATION IN ADMINISTERING AN URBAN DRAINAGE ORDINANCE,**
Hydrocomp, Inc., Palo Alto, Calif.
T. N. Debo, and A. M. Lumb.
Simulation Network Newsletter, Vol 7, No 2, p 1-8, February 15, 1975. 6 ref.

Descriptors: *Computer models, *Legislation, *Drainage, *Cities, Floods, Storm runoff, Hydrologic aspects, Administration, *Simulation analysis.
Identifiers: Hydrologic simulation.

A computer-simulated model urban drainage ordinance based on problems, ordinances, and experiences of urban areas was drafted. Emphasis was placed on the interaction between the technical and non-technical aspects of practical drainage problems. Contacts were made with over thirty cities and counties throughout the United States to determine which areas had relevant experience, whether they would participate in the study, and whether they felt they could benefit from results of such a study. Five areas were chosen. The drainage program of each area was intensively investigated and data were compiled into case studies. Some provisions of the model ordinance which was then drafted could pose administrative and engineering problems during implementation, which could be better handled with the help of modelling. Hydrologic computer simulation is a technical tool that may be used with minimal training by engineers of local governments and consulting firms to evaluate the effects of developments, drainage problems, and potential solutions. Once calibrated for a region, a model can be used throughout that area to get a consistent and more accurate approach for evaluating flood and drainage problems. For example, on-site storage facilities are often used in urban areas for controlling storm runoff. However, analysis of their synergistic effects is necessary to prevent potential flood peaks--a problem rapidly solved by computer simulation. Hydrologic simulation results in lower error, greater forecasting capability, enhanced ability to analyze interactive drainage characteristics, and requirements of different areas.

Identifiers: Environmental corridor selection, Linear corridor selection, Interdisciplinary analysis, *Environmental impact analysis, *Overlay mapping, *Computer graphics, Value ratings

Several techniques for selecting a least environmental impact corridor have been proposed. Two approaches have been found workable: computer graphics and overlay mapping. This report combines features of both approaches to determine an appropriate routing for a water conveyance canal. The evaluation study was conducted by an interdisciplinary planning team. Environmental factors were mapped and weighted on overlay maps. Alternative routes were identified and carefully studied. Several critical environmental implications were noted. Aesthetic factors, outdoor recreation interpretation, visitor safety and disruption of human and animal travel routes were considered. Evaluation of an environmental analysis procedure requires close examination of the project objectives, scope, and ultimate decision making body that will ultimately utilize the findings. Size and scale of project play important roles when examining cost figures. The overlay map procedure provides an effective graphic media through which the process of selecting and evaluating alternative linear corridors can be presented. The importance of an interdisciplinary planning team cannot be stressed enough. (Bell-Cornell)

**LAND USE AND ENVIRONMENTAL PLANNING: AN APPLICATION IN THE SOUTH CAROLINA COASTAL ZONE,**
Battelle-Columbus Labs., Ohio.
G. Nehman, G. Boles, N. Dee, and J. Griffin.
Water Resources Bulletin, American Water Resources Association, Vol 11, No 4, p 759-769, August 1975. 4 tab, 2 ref.

Descriptors: *Land use, *Land development, *Environment, *Planning, *Coasts, *South Carolina, Regulation, Economics, Social aspects, Methodology, Compatibility, Data collections, Constraints, Model studies, Evaluation, Maps, Systems analysis.
Identifiers: *Beaufort County(SC), Map overlays, Suitability analysis.

Considered is Beaufort County, South Carolina's approach to dealing with the problem of land use controls. A rural, highly polarized coastal community, Beaufort County opted to set regulations for controlling its development in the face of conflicting interests. An analysis tool with economic, environmental, and social conditions as criteria for setting regulations was developed; described is the Land Use Trade-Off Model (LUTOM) and its application to Beaufort County. The model was used to define locations best suited for each size and type of desired land use within the region, to define policies which were constraints to development, and to analyze the compatibility between adjacent land uses. Map overlays were used for analyzing and aggregating the economic, environmental, and social data. Various land use categories were evaluated using a numerical scoring system, and the scores were then used to assist in developing the land use regulations. In conclusion, LUTOM provides a workable analysis tool with analytical and reproducible output that can be used for land use planning and control; it yields a rationale for setting regulations, the mechanism for which lies with the local county council and related groups. Despite its successful use in a rural community, however, it would probably need to be computerized to deal with complex urban systems. LUTOM is most useful in defining broad policy issues; it can also be used to rate alternative sites for a particular development proposal. (Bell-Cornell)

**QUALITY OF SURFACE WATERS OF THE UNITED STATES, 1970: PART 1. NORTH ATLANTIC SLOPE BASINS.**
Geological Survey, Reston, Va.
Available from Sup of Documents, GPO, Washington, DC 20402 $5.55 (paper copy). Water-Supply Paper 2151, 1975. 674 p, 1 fig, 41 ref.

Descriptors: *Water quality, *Surface waters, *Sediment transport, *Water temperature, *Northeast US, River basins, Basic data collections, Connecticut, Delaware, Maine, Maryland, Massachusetts, New Hampshire, New Jersey, New York, Pennsylvania, Rhode Island, Vermont, Virginia, West Virginia, District of Columbia, Physical properties, Particle size, Chemical analysis, Inorganic compounds, Biological properties, Streamflow, Sampling, Sites, Surface waters.
Identifiers: *North Atlantic slop basins.

During the water year ending September 30, 1970, the Geological Survey maintained 238 stations on 139 streams in the North Atlantic slope basins for the study of chemical and physical characteristics of surface water. Samples were collected daily and monthly at 183 of these locations for chemical-quality studies. Samples also were collected less frequently at many other points. Water temperatures were measured continuously at 72 and daily at 28 stations. Daily water temperatures were measured at most of the stations at the time samples were collected for chemical quality or sediment content. So far as practicable, the water temperatures were taken at about the same time each day. Quantities of suspended sediment are reported for 36 stations during the year ending September 30, 1970. Sediment samples were collected one or more times daily at most stations, depending on the rate of flow and changes in stage of the stream. Particle-size distributions of sediments were determined at 17 stations. The stream discharge reported for a composite sample is usually the average of daily mean discharges for the composite period. The discharges reported in the tables of single analyses are either daily mean discharges or discharges obtained at the time samples were collected and computed from a stage-discharge relation or from a discharge measurement. (Woodard-USGS)

**QUALITY OF SURFACE WATERS OF THE UNITED STATES, 1970: PART 2. SOUTH ATLANTIC SLOPE AND EASTERN GULF OF MEXICO BASINS.**
Geological Survey, Reston, Va.
Available from Supt of Documents, GPO, Washington, DC 20402 $5.45 (paper copy). Water-Supply Paper 2152, 1974. 668 p, 1 fig, 41 ref.

Descriptors: *Water quality, *Sediment transport, *Water temperature, *Streams, *Southeast US River basins, Atlantic Ocean, *Gulf of Mexico, Basic data collections, Chemical analysis, Physical properties, Inorganic compounds, Biological properties, Streamflow, Sampling, Sites.
Identifiers: *South Atlantic Slope basins, *Eastern Gulf of Mexico basins.

During the water year ending September 30, 1970, the Geological Survey maintained 180 stations on 119 streams in the South Atlantic Slope and Eastern Gulf of Mexico basins for the study of chemical and physical characteristics of surface water. Samples were collected daily and monthly at 161 of these locations for chemical-quality studies. Samples also were collected less frequently at many other points. Water temperatures were measured continuously at 33 and daily at 53 stations. Daily water temperatures were measured at most of the stations at the time samples were collected for chemical quality or sediment content. So far as practicable, the water temperatures were taken at about the same time each day. Quantities of suspended sediment are reported for 6 stations. Sediment samples were collected one or more times daily at most stations, depending on the rate of flow and changes in stage of the stream. Particle-size distributions of sediments were determined at 1 station. The stream discharge reported for a composite sample is usually the average of daily mean discharges for the composite period. The discharges reported in the tables of single analyses are either daily mean discharges or discharges obtained at the time samples were collected and computed from a stage-discharge relation or from a discharge measurement. **QUALITY OF SURFACE WATERS OF THE UNITED STATES, 1968: PART 3. OHIO RIVER BASIN.**
Geological Survey, Reston, Va.
Available from Supt of Documents, GPO, Washington, DC 20402 $2.10 post-paid $1.75 GPO Bookstore. Water-Supply Paper 2093, 1973. 309 p, 1 fig, 39 ref.

Descriptors: *Water quality, *Sediment transport, *Water temperature, *Ohio River, Alabama, Illinois, Indiana, Kentucky, Maryland, New York, North Carolina, Ohio, Pennsylvania, Tennessee, Virginia, West Virginia, Basic data collections, Streamflow, Chemical analysis, Physical properties, Inorganic compounds, Biological properties, Sampling, Sites.
Identifiers: *Ohio River basin.

During the water year ending September 30, 1968, the Geological Survey maintained 141 stations on 92 streams for the study of chemical and physical characteristics of surface water in the Ohio River Basin. Samples were collected daily and monthly at 75 of these locations for chemical-quality stu-

dies. Samples also were collected less frequently at many other points. Water temperatures were measured continuously at 67 and daily at 42 stations. Daily water temperatures were measured at most of the stations at the time samples were collected for chemical quality or sediment content. So far as practicable, the water temperatures were taken at about the same time each day. Quantities of suspended sediment are reported for 21 stations during the year ending September 30, 1968. Sediment samples were collected one or more times daily at most stations, depending on the rate of flow and changes in stage of the stream. Particle-size distributions of sediments were not determined. The stream discharge reported for a composite sample is usually the average of daily mean discharges for the composite period. The discharges reported in the tables of single analyses are either daily mean discharges or discharges obtained at the time samples were collected and computed from a stage-discharge relation or from a discharge measurement. **SURFACE WATER SUPPLY OF THE UNITED STATES, 1966-70: PART 6. MISSOURI RIVER BASIN--VOLUME 3, MISSOURI RIVER BASIN FROM SIOUX CITY, IOWA, TO NEBRASKA CITY, NEBRASKA.**
Geological Survey, Reston, Va.
Available from Supt of Documents, GPO, Washington, DC 20402 $3.45 postpaid $3.00 GPO Bookstore. Water-Supply Paper 2118, 1973. 71 p, 1 fig.

Descriptors: *Basic data collection, *Streamflow, *Flow rates, *Missouri River, Iowa, Minnesota, Wyoming, Colorado, Nebraska, Runoff, Discharge(Water), Gaging stations, Flow measurement, Average flow.
Identifiers: *Missouri River basin, Maximum discharges, Minimum discharges.

This report is one of a series of 37 reports presenting records of stage and discharge of streams, of stage and contents of lakes and reservoirs in the United States during the 1966-70 water years. It contains the records for gaging stations and partial-record stations in the Missouri River basin from Sioux City, Iowa, to Nebraska City, Nebraska. This is one of the second series of water-supply papers to be published on a 5-year basis. The first series covered the 5-year period October 1, 1960, to September 30, 1965. This series covers the period October 1, 1965, to September 30, 1970. The daily table for stream-gaging stations gives the mean discharge for each day and is followed by monthly and yearly summaries of total, average, maximum and minimum discharges. (Woodard-USGS)

**GROUND-WATER DATA FOR BOLIVAR COUNTY, MISSISSIPPI,**
Geological Survey, Jackson, Miss.
G. J. Dalsin, and B. E. Wasson.
Mississippi Board of Water Commissioners, Jackson, County Report No 1, 1975. 55 p, 7 fig, 1 plate.

Descriptors: *Groundwater resources, *Basic data collections, *Hydrologic data, *Water quality, *Mississippi, Water wells, Well data, Water levels, Aquifer characteristics, Water utilization, Water yield, Chemical analysis.
Identifiers: *Bolivar County(Miss), Sand intervals.

Ground-water basic data in Bolivar County, Miss., are presented in 4 tables and 8 illustrations. Almost 2,000 wells are described and located. Chemical analyses, and intervals on electric logs, and the geologic section are tabulated. The occurrence of groundwater in Bolivar County is illustrated by geohydrologic sections and an aquifer thickness map. Examples of water-levels changes in wells are shown. (Woodard-USGS)

**GROUND-WATER DATA IN THE HARRISBURG - HALSEY AREA, CENTRAL WILLAMETTE VALLEY, OREGON,**
Geological Survey, Portland, Oreg.
F. J. Frank, and N. A. Johnson.
Oregon State Engineer, (Salem), Ground Water Report No 22, 1975. 48 p, 3 fig, 1 plate, 3 tab, 14 ref.

Descriptors: *Groundwater resources, *Basic data collections, *Water yield, *Water quality, *Oregon, Well data, Drillers logs, Water levels, Aquifer characteristics, Water utilization, Chemical analysis, Hydrographs.
Identifiers: *Central Willamette Valley(Oreg), *Harrisburg - Halsey area(Oreg).

The Harrisburg-Halsey area covers about 350 square miles in the central Willamette Valley, Oreg., and is part of a broad alluvial plain that lies between the Cascade and Coast Ranges in the central part of the Willamette Valley. Most of the data for the 506 wells in this report were obtained from well drillers' reports. Chemical analyses of water from 36 wells are tabulated. Most of the high-yield wells in the area produce water from alluvial (sand and gravel) aquifers that underlie the valley plain or that are coextensive with the present flood plain of the Willamette River. The water table in the alluvial aquifer is generally only a few feet below land surface. Pumping lifts are relatively small, and wells produce moderate to large quantities of groundwater of good chemical quality. (Woodard-USGS)

**GROUND-WATER LEVELS IN LOUISIANA--FOR WELLS MEASURED THROUGH 1974.**
Geological Survey, Baton Rouge, La.
Louisiana Department of Public Works, Baton Rouge, Water Resources Basic Records Report No 7, 1975. 548 p, 57 fig, 54 tab, 6 ref.

Descriptors: *Water wells, *Water levels, *Well data, *Louisiana, *Data collections, Aquifers, Observation wells, Hydrologic data, Groundwater.

This report includes data for the entire period of record for 599 wells in 54 parishes in Louisiana. The assemblage of water-level records has been divided into two parts--'currently measured wells' and 'formerly measured wells.' Currently measured wells are observation wells that are included in the current network and were measured during the period 1971-74. Water levels for current wells are included for the entire period of record. Formerly measured wells are observation wells in which measurements were discontinued prior to 1971. Records for these wells will be published in a subsequent report. The observation-well program in Louisiana was established in 1939. (Woodard-USGS)

**EVAPORATION DATA IN TEXAS,**
Texas Water Development Board, Austin.
J. P. Dougherty.
Report 192, June 1975. 237 p, 6 fig, 122 tab.

Descriptors: *Evaporation, *Texas, Stations, *Evaporation pans, Federal government, State governments, Local governments, Data collections, Administrative agencies, Cities, Atmometers, *Data collections.
Identifiers: *Evaporation data, *Evaporation stations, Local interests, Bureau of Plant Industry pan, National Weather Service pan, Young screen pan.

Available historical pan-evaporation data obtained in Texas, spanning a 64-year period from January 1907 to December 1970, were presented. Data gathered from 114 evaporation stations in operation in Texas during some part of the period were compiled. Most evaporation measurements were made with three types of pans: the Bureau of Plant Industry pan, the National Weather Service pan, and the Young screen pan. Several other pan types and the evaporometer have been utilized in Texas, but the volume of record obtained with these was small compared to that from the three main types of evaporation pans. The measuring devices were described completely, with photographs of installations and plans and specifications. The bulk of the report consisted of 122 data charts. It was mentioned that because of wind and other conditions, pan evaporation was not applicable to bodies of water unless proper numerical coefficients, typically between 0.6 and 1.2 for areas in Texas, are applied to the data. **LARGE DIAMETER SUBMARINE STEEL PIPELINE CROSSINGS,**
Greater Vancouver Sewage and Drainage District (British Columbia).

D. Mackay.
In: Proceedings of the Annual Conference of the British Columbia Water and Waste Association, April 9-11, 1974, Vancouver, British Columbia, p 71-92, 24 fig.

Descriptors: *Pipelines, *Pipes, *Sewerage, Water conveyance, Distribution systems, Steel pipes.
Identifiers: *Submarine pipeline crossings.

The Greater Vancouver area of British Columbia presents many engineering problems for the bulk transportation of water and sewage. To solve these problems, numerous summarine pipelins crossings have been installed at various sewage and water districts. To minimize the cost of the river crossings, new methods for assembling the units on land and pulling them into a dredged trench were devised. Innovative techniques have been developed for the installation of pipelines in large, fast moving alluvial rivers. The main features of the design and construction of six steel pipe submarine crossings are discussed. Some of the unique design features and new construction techniques for the installation of these large diameter steel submarine construction techniques for the installation of these large diameter steel submarine conduits include: a circular profile system which places no limit on the size and weight of conduit that can be installed as long as the circular profile can be achieved by open cut; the flectural bending of large diameter steel pipes to a degree of curvature greater than that previously used; and the launching of large diameter multiple steel pipes in a single package from timber skids on shore. The circular profile system is particularly useful where the launching space is restricted and the diameter of the pipe precludes the use of flectural bending. In the crossings described, the radii of curvature for 48, 54, and 66 inch pipe have been limited to 2400, 3000, and 4000 feet, respectively. (Orr-FIRL)

**CENTER PIVOT DESIGN CAPACITIES IN EASTERN COLORADO,**
Agricultural Research Service, Fort Collins, Colo.
D. F. Heermann, H. H. Shull, and R. H. Mickelson.
Journal of the Irrigation and Drainage Division, Proceedings of American Society of Civil Engineers, Vol 100, No IR2, p 127-141, June, 1974. 9 fig, 3 tab, 15 ref.

Descriptors: *Sprinkler irrigation, *Irrigation design, Irrigation engineering, Irrigation practices, Irrigation systems, Flow rates, Design flow, *Colorado.
Identifiers: *Center pivot irrigation.

Design system capacities were developed for center pivot sprinklers irrigating corn in the Central Great Plains by simulating irrigations for 60 years of climatic data collected at Akron, Colorado. The system design provides three probability levels of net irrigation requirements versus optimum soil water depletion as affected by soils with various water holding capacities. The design system capacities developed from the simulation model allow for the depletion of available soil water. An empirical procedure for determining the net system capacity from ET(net) as affected by allowable depletion level is presented. (Skogerboe-Colorado State)

Uttar Pradesh Irrigation Research Inst., Roorkee (India).
H. D. Sharma, and A. S. Chawla.
Journal of the Irrigation and Drainage Division, Proceedings of American Society of Civil Engineers, Vol 100, No IR3, p 351-369, September, 1974. 11 fig, 5 ref, 2 append.

Descriptors: *Canal seepage, Seepage, *Seepage control, Drainage effects, *Drainage practices, *Drains.

An analytical solution is obtained with the help of conformal mapping for the problem of steady seepage from a canal into an interceptor drain and to the main drainage lain in homogeneous and isotropic medium extending to infinite depth. Equations have been given to determine the seepage discharge into the drain and the coordinates of the phreatic surface. The solutions of the equations have been presented in the form of dimensionless curves to facilitate computations. The analysis indicates that discharge to the interceptor drain increases with an increase in the bed width of the channel and diameter of interceptor drain, whereas it decreases with an increase in distance between the canal and the interceptor drain. As the drain is brought closer to the canal, the rate of increase of seepage into the drain increases. The effect of the drain diameter in intercepting seepage discharge is more pronounced at a deeper setting of the drain. (Skogerboe-Colorado State)

**WATER HAMMER IN COAXIAL PIPE SYSTEMS,**
Karlsruhe Univ. (West Germany). Institut fuer Hydro-mechanik, Staunanlagen und Wasserversorgung.
W. Burmann.
Journal of the Hydraulics Division, Proceedings of American Society of Civil Engineers, Vol 101, No HY6, Proceedings Paper 11374, p 699-715, June 1975. 12 fig, 4 ref, 2 append.

Descriptors: *Water hammer, *Pipe flow, Pipelines, Pipes, Hydraulics, Tubes, Numerical analysis, Waves(Water).
Identifiers: *Coaxial pipe systems, *Wave equations, *Characteristic method, Wave dispersion, Wave propagation, Computation.

Transporting fluids involves the use of coaxial pipe systems in which water hammer may occur due to pump failure or valve operation. Investigations into the behavior of water hammer phenomena in such pipe systems of several different flow sections were reported. The solution of the differential equations covering nonstationary fluid flow in pipe systems of several different flow sections by means of the method of characteristics was sketched. The wave propagation as well as the transmission and reflection of waves at changes in diameter or density, and at pipe junctions, were expressed by the simplest possible formulas. (Lee-ISWS)

**SUBMERGED BUOYANT JETS IN QUIESCENT FLUIDS,**
Stone and Webster Engineering Corp., Boston. Mass. Environmental Engineering Div.
D. T. L. Chan, and J. F. Kennedy.
Journal of the Hydraulics Division, Proceedings of American Society of Civil Engineers, Vol 101, No HY6, Proceedings Paper 11383, p 733-747, June 1975. 6 fig, 25 ref. ONR Contract N00014-68-A-0196-0004.

Descriptors: *Buoyancy, *Temperature, Turbulence, Hydraulics, Diffusion, Entrainment, Diffusivity, Fluid mechanics, Jets, Flow, Thermal water, Discharge(Water), Numerical analysis.
Identifiers: *Jet flows, *Plumes, Diffusers, Quiescent fluids, Jet momentum, Buoyant jets.

An integral-type analysis was developed for submerged buoyant jets discharged horizontally into quiescent homogeneous fluids. Equations for conservation of volume flux, buoyancy flux, and kinematic conditions were combined with three self-similarity assumptions and one entrainment assumption. The entrainment velocity was assumed to consist of two components, one related to the initial jet momentum and the second to the buoyancy force, so that the entrainment coefficients obtained from studies of pure jets and pure plumes could be utilized. A closed-form solution was obtained which yielded polynomials describing the trajectories of both round and slot jets and linear and parabolic relations for the dilution for round and slot jets, respectively. These relations compared favorably with experimental and numerical results reported by other investigators. (Lee-ISWS)

**BOUNDARY SHEAR IN CHANNEL WITH FLOOD PLAIN,**
Halcron (William) and Patners, London (England).
R. C. Myers, and E. M. Elsawy.
Journal of the Hydraulics Division, Proceedings of American Soceity of Civil Engineers, Vol 101, No HY7, Proceedings Paper 11452, p 933-946, July 1975. 14 fig, 2 tab, 13 ref, 2 append.

Descriptors: *Earth-water interfaces, *Channel flow, *Flood plains, *Shear stress, Shear, Hydraulics, Momentum transfer, Channels, Boundaries(Surfaces), Cross-sections.
Identifiers: *Preston tube, *Boundary shear, Interaction, Complex cross sections.

Shear stress distributions were measured around the periphery of a channel of complex cross section using Preston tube. The complex section consisted of a deep channel and a flood plain. The measurements were carried out in the laboratory for flow in the full cross section and when the flow was confined to the deep section. In this way it was possible to compare shear stress distributions under both isolated and interacting conditions. It was revealed that the presence of the interactions between a channel and its flood plain significantly alters the values and distributions of boundary shear. The interaction mechanism increases average flood plain shear, falling off as depth increases, and has the effect of decreasing channel shear and altering the shear stress distribution shape. **HYDRAULIC MODEL STUDIES OF A SECOND POWERHOUSE AT ROCK ISLAND HYDROELECTRIC PROJECT,**
Washington State Univ., Pullman. Coll. of Engineering Research Div.
A. F. Babb.
Bulletin 326, 1972. 116 p, 13 fig, 11 tab, 5 ref, 5 plates, 4 append.

Descriptors: *Hydraulic models, *Hydraulic structures, *Washington, *Columbia River, Model studies, Spillways, Fish passages, Hydroelectric plants, Channels, Navigation, Dams, Intakes structures, Outlets, Discharge(Water, Currents(Water), Laboratory tests, Hydraulic similitude, Distribution patterns, Velocity, Water levels, Calibrations.
Identifiers: *Rock Island Hydroelectric Project(Wash).

A second powerhouse facility is proposed for the Rock Island Hydroelectric Power Project, located on the Columbia River near Wenatchee, Washington. The modified river flow patterns were studied with the use of a 1:75 scale model. Included were investigations of (1) the flood-passing capability of both the existing and proposed structures, (2) the establishment of the best orientation of the new powerhouse from the standpoint of maximizing power output, and (3) the creation of flow patterns that would be compatible with the passage of anadromous fish and possible future navigation. Test results were summarized for spillway capacity, powerhouse orientation, navigation, and fish facilities. Appendixes presented data for model verification, velocities and flow patterns for existing structures, velocities and flow patterns for powerhous orientation tests, and navigation approach channel velocities. **SCALE EFFECTS ON COOLING TOWER MODEL STUDIES,**
Iowa Inst. of Hydraulic Research, Iowa City.
T. W. Bugler, III, and J. C. Tatinclaux.
IIHR Report No 168, September 1974. 95 p, 58 fig, 8 tab, 8 ref.

Descriptors: *Hydraulic models, *Cooling towers, *Jets, *Temperature, *Model studies, Laboratory tests, Dimensional analysis, Density, Froude number, Reynolds number, Turbulence, Entrainment, Flumes, Mechanical control, Discharge(Water), Heated water, Thermal pollution.
Identifiers: *Mechanical cooling towers, *Scale effects(Models), Heated discharge, Blockage.

Scale effects had been observed in model studies of mechanical draft cooling towers. Four models with scale ratios of 1/150 and 1/504 were tested in a flume. Scale and blockage effects were investigated by recording temperature distributions in the plume from the cooling tower model. Lateral blockage was found to be no problem. The limited vertical depth was a problem if the jet velocity was more than twice the ambient current velocity in the flume. Limiting scale, width, and depth ratios were determined. (Adams-ISWS)

**PROGRESS REPORT TO THE ARKANSAS STATE HIGHWAY COMMISSION FOR YEAR ENDING JUNE 30, 1975,**
Geological Survey, Little Rock, Ark.
M. S. Hines
Open-file report, 1975. 21 p, 1 fig, 1 plate, 1 tab.

Descriptors: *Hydrologic data, *Flood frequency, *Peak discharge, *Bridge construction, *Arkansas, Open channel flow, Hydraulics, Flow characteristics, Flow around objects.
Identifiers: Progress report

The economic design of bridges and culverts requires a knowledge of the magnitude and frequency of floods for all size drainage basins. The Arkansas State Highway Commission and the U.S. Geological Survey are cooperating in a program to provide information concerning flood frequency and open-channel hydraulics. A summary of the accomplishments of the program is presented. Included are plans for future work and a brief description of related water-resources programs of the Geological Survey in Arkansas. The primary objective is to define regional flood frequency relations for Arkansas, with particular emphasis placed on drainage areas of less than 5 square miles. The secondary objective is to analyze the hydrologic and hydraulic floodflow characteristics at specific bridge sites. In addition the program includes the documentation of unusual small-area floods. The network of 10 crest-stage stations was operated to determine the annual peak stage and discharge at all sites. (Woodard-USGS)

**HYDRAULIC DESIGN OF VERTICAL STILLING WELLS,**
Bureau of Reclamation, Denver, Colo. Div. of Research.
P. H. Burgi.
Journal of the Hydraulics Division, Proceedings of American Society of Civil Engineers, Vol 101, No HY7, Paper 11451, p 801-816, July 1975. 12 fig, 1 tab, 7 ref, 2 append.

Descriptors: *Energy loss, *Design criteria, *Hydraulic models, *Cavitation, Hydraulics, Hydraulic structures, Dimensional analysis.
Identifiers: *Vertical stilling wells, *Sleeve valve, Corner fillet, Corner angle.

Vertical stillings wells are economical and ideally suited to dissipate high energy flow. Model studies established general design criteria for vertical stilling wells using a standard sleeve valve. Dimensionless parameters based on design discharge and valve diameter D were established to aid the designer in determining optimum well size for a specific need. Over 100 tests were conducted on two laboratory models to determine stilling well geometry. Corner fillet and corner angle provided the best design configurations. A graphical method of presentation was included to aid the designer in sizing the vertical stilling well, and design example demonstrating the method was presented. (Lardner-ISWS)

escriptors: *Conduits, *Turbulence, *Turbulent ow, Fluid mechanics, Hydraulics, Friction, Mo- entum transfer, Non-Newtonian flow, Pipe flow. lentifiers: *Power-law fluids, *Reynolds stress, lixing length, Fanning friction factor.

elocity profiles for the steady incompressible rbulent flow of power-law fluids through circu- r conduits were calculated by numerical quadra- re considering both the viscous stresses and the eynolds stresses operative over the entire cross ction of the flow. A non-Newtonian stress coef- cient, K sub n, was introduced along with mixing ngth, 1, so that the Reynolds stresses could be t in a form similar to that of the viscous stresses. he form of the Reynolds stresses thus obtained duced to the Newtonian form when the flow havior index, n, equaled unity. Both l and K sub were assumed dependent upon the Reynolds mber. Similarly, friction factors for the turbu- nt flow of power-law fluids were calculated by merical quadrature. The calculated friction fac- rs were compared to 146 measured friction fac- rs over a range of Reynolds numbers from 2670 108,800. The mean absolute difference between lculated and measured friction factors for this mple was 3% with a standard deviation of 1.9%. ee-ISWS)

ntifiers: *Boundary shear, Two phase flow, ll shear stress, Skin friction, Sand-water mix- e flow.

e wall shear stress was measured in clear-water l sand-water mixture flows with the use of a sh-mounting hot-film shear-sensor. Data were ained with two shear-sensors and two different ds (d50 = 0.45 mm and d50 = 0.88 mm) with ids concentrations of up to maximum C = 1.6% volume, and for flow Reynolds numbers of ,000 less than RD less 600,000. The 'measured' sor wall shear stresses were compared with the e' wall shear stresses obtained with the energy d loss measurements conducted in a pipeline tem. The results of the tests in the clear-water ws confirmed the relationship between the sen- power output, P sub S, and the cubic root of wall shear stress having linear relationship. e tests with the low-concentration sand-water tures in a vertical pipe indicated that, for the sent range of experiments, sensor power out- s with the mixtures exceeded those for clear- er by an average of 5%. It is shown that the ar-sensors are delicate but accurate instru- nts that can be used for the measurement of the l shear stress. (Lee-ISWS)

**TURBULENT DRAG COEFFICIENTS OF SHARP-EDGED OBJECTS,**
Ecole Polytechnique Federale de Lausanne (Switzerland). Laboratoire d'Hydraulique.
W. H. Graf, and F. F. Mansour.
Journal of Hydraulic Research, Vol 13, No 2, p 127-147, 1975. 10 fig, 14 ref.

Descriptors: *Turbulence, *Drag, Dimensional analysis, Fluid mechanics, Reynolds number, Hydrodynamics, Turbulent flow.
Identifiers: *Turbulence intensity, *Drag coefficients, *Turbulence scale, Empirical relations, Bluff bodies, Cubes, Square rods, Circular cylinders.

The drag coefficient in turbulent flow has been found to be a function of the turbulence intensity, a dimensionless turbulence scale, and the Reynolds number. Ko and Graf combined these three factors into a single term called the 'turbulence characteristics' for circular cylinders. The correlation was extended here to sharp-edged objects, such as cubes and square rods. The ratio of the turbulence intensity squared to the drag coefficient was found to yield a better correlation with the turbulence characteristics parameter than the drag coefficient. The plots of published data for cubes and square rods showed trends similar to the plot for the circular cylinder. (Adams-ISWS)

Identifiers: *Fluid flow, Finite difference approximation, Rough beds.

Presented are the results of analytical and numerical solutions for the velocities produced by progressive water waves in the boundary layer above a two-dimensional rough bed. The fluid velocities close to the two-dimensional rough bed were calculated for laminar oscillatory flow, similar to that produced by waves near the seabed. At low Reynolds numbers a small-perturbation procedure was used and at high Reynolds numbers the equations of motion were solved numerically, using a finite-difference approximation. The numerical solution indicates that the flow remains laminar up to much higher Reynolds numbers than has previously been supposed, and this conclusion is confirmed by hot-wire anenometer measurements. Comparison of the computed velocity profile with measurements by Kalkanis suggests that the mean velocities may still be well represented by the numerical solution even when the flow does become turbulent. The solution involves no experimentally-determined constants and applies to situations of practical importance, and also to flow over flat beds of sand provided an appropriate definition of roughness length is used. Descriptors: *Coastal engineering, *Gabions, *Rock fill, *Waves(Water), Structures, Embankments, Porous media, Shallow water, Analytical techniques, Unsteady flow, Water levels, Hydraulics, Equations, Mathematical models, Systems analysis.
Identifiers: *Wave propagation, *Wave runup, Nonlinear systems, Reflection, Wave steepness, Transmission data, Impervious cores, Multilinear regression, Experiments, Non-Darcy flow.

Unsteady non-Darcy flow in rectangular rock-fill embankments with impervious cores was studied experimentally by subjecting the embankments to nonlinear, shallow water waves. Crushed rock and quartz were utilized, in sizes ranging from 0.7 cm to 4.4 cm, to build embankments of various widths. The waves in all experiments were nonbreaking. The embankments were tested for several wave conditions. Empirical formulas are presented for transmission, reflection, runup, and rushdown, and all give good correlations. An upward shift of the mean water level in the embankments was detected during the experiments. It was found that transmission decreased with decreasing conductivity and increasing wave steepness and embankment width, and that reflection decreased with increasing conductivity and width of embankment. **WAVE ENERGY TRANSFER MECHANISMS IN WIND-WAVE TUNNELS,**
Amoco Production Co., Tulsa, Okla.
J. B. Bole.
Journal of the Waterways, Harbors, and Coastal Engineering Division, Proceedings of the American Society of Civil Engineers, Vol 100, No WW4, Proceedings paper No 10932, p 325-344, November 1974. 8 fig, 5 tab, 22 ref.

Descriptors: *Air-water interfaces, *Waves(Water), *Dispersion, *Energy transfer, *Coastal engineering, Height, Deep water, Shear stress, Measurement, Equations, Mathematical models, Gravity waves.
Identifiers: *Wind-wave tunnels, Ocean engineering, Normal stress, Experiments, Graphs.

Theoretical and experimental results are reviewed for five exponential mechanisms that operate on small-amplitude deepwater gravity waves in wind-wave tunnels. Energy source term mechanisms are those due to: (1) tangential shear stress; (2) phase-shifted normal stress; and (3) airflow-pressure-gradient normal stress. Energy sink term mechanisms include only those due to viscous dissipation in the far field, and in the wall boundary layers. The results of experiments by Liang are shown to compare favorably with the theoretical airflow-pressure-gradient normal stress and to confirm its importance. On the basis of this result, phase-shifted normal stress is recalculated for the laboratory wave growth data of Bole and Hsu and is found to be an average of only 1.7 times the theoretical results of the Miles inviscid shear-flow model. This finding is in substantial agreement with the recent field measurements of Elliot, but it

is in disagreement with earlier field investigations. Graphs are presented to illustrate the relative importance of the five energy transfer mechanisms for laboratory experimental conditions. (Bell-Cornell)

**CAVITATION IN BUTTERFLY VALVES,**
Colorado State Univ., Fort Collins.
J. W. Ball, and J. P. Tullis.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 99, No HY9, Proceedings paper No 9993, p 1303-1318, September 1973. 12 fig, 2 tab, 15 ref.

Descriptors: *Butterfly valves, *Cavitation, *Flow control, *Hydraulics, *Pipe flow, Pipelines, Data collections, Water conveyance, Pressure, Size, Design criteria, Equations, Evaluation.

Tests made at Colorado State University have resulted in a generalization of cavitation data, making them useful in developing pipeline designs utilizing butterfly valves as control. Related cavitation design criteria evolved from the tests and the cavitation parameters considered in developing designs for water systems in which butterfly valves are used are presented. Methods for defining capacity and specific degrees of cavitation intensity (incipient, critical, and choking or supercavitation) and for evaluating cavitation design limits are given. The importance of scale effects related to system pressure and size of valve is stressed and procedures for adjusting for these scale effects are outlined. The cavitation characteristics of butterfly valves have been generalized and an example of the application of these data to the design of water conveyance systems is offered. The performance characteristics of valves makes the upstream end or the low point in the pipeline the optimum location when it is desired to minimize noise and damage due to cavitation (free discharge not considered). The design example given considers this performance characteristic. (Bell-Cornell)

**ENERGY LOSSES AT 90 DEGREES PIPE JUNCTIONS,**
Tohoku Univ., Sendai (Japan). Inst. of High Speed Mechanics.
H. Ito, and K. Imai.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 99, No HY9, Proceedings paper No 10022, p 1353-1368, September 1973. 12 fig, 3 tab, 23 ref.

Descriptors: *Pipe flow, *Hydraulics, *Head loss, *Junctions, Energy loss, Flow resistance, Water distribution(Applied), Diameter, Design, Reynolds number, Equations.
Identifiers: *Tees, Formulas.

The problem of determining the energy loss caused by the combination and division of flow at pipe junctions has been considered. The loss coefficients and the power-loss coefficients for four smooth tees with diameter ratio of unity were determined experimentally for each of all configurations of flow through tees. Through-out the test, the Reynolds number before the division or after the combination of flow was within the range of 10 to the 5th power - 2x10 to the 5th power. The radius of curvature of the wall at the joining edge ranged from zero up to half the diameter of the straight pipe. Empirical formulas for loss coefficients and those for power-loss coefficients which are in good agreement with experiments were presented for each configuration of flow. Empirical formulas for loss coefficients for dead end tees were also given. The comparison of the proposed formulas with the experimental results of previous investigators showed that the proposed formulas can be used to reliably estimate the energy losses at tees. (Bell-Cornell)

Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 99, No HY11, Proceedings paper No 10158, p 1933-1945, November 1973. 12 fig, 6 ref.

Descriptors: *Hydraulics, *Flow, *Fluid friction, Hydrodynamics, Pipe flow, Shear stress, Unsteady flow, Frequency, Mathematical models, Forecasting.
Identifiers: *Friction coefficient(Hydraulic).

Measured data of velocity changes in oscillatory flow (o.16Hz-0.36Hz) are presented. The actual wall shear stresses obtained from these measurements are compared to calculated values based on steady flow relations and Zielke's model. A new model for the prediction of the wall shear stress as a function of velocity and acceleration changes is introduced. The proposed model may be a suitable basis for the prediction of friction data for one-dimensional flow analysis under nonsteady conditions. (Bell-Cornell)

**SIMULATION OF DISPERSION OF SUSPENDED PARTICLES,**
Technical Univ. of Istanbul (Turkey). Dept. of Civil Engineering.
B. M. Sumer.
Journal of the Hydraulics Division, Proceedings of the American Society of Civil Engineers, Vol 99, No HY10, Proceedings paper No 10056, p 1705-1726, October 1973. 8 fig, 2 tab, 17 ref, 3 append.

Descriptors: *Open channel flow, *Sediment transport, *Simulation analysis, *Numerical analysis, *Dispersion, *Hydraulics, *Uniform flow, Turbulent flow, Diffusion, Shear, Flow, Suspended load, Equations, Mathematical models, Systems analysis, Velocity, Digital computers.
Identifiers: Lagrangian functions.

Using the Lagrangian approach, the dispersion of suspended particles in turbulent open-channel flow is numerically simulated using a digital computer. Statistical properties which include the mean and variance of the distribution and probability density function of particle coordinates are computed for a certain range of the settling velocity parameter. The boundary condition at the bottom is assumed so that there is no particle entrainment in the flow from the bottom and no particle deposition on the bottom, i.e., particles remain in suspension motion all the time. The path of an initially marked particle is followed as it goes through statistical field variables. Many such paths are used to compile the probability distribution by an ensemble average. Two types of results are obtained: (1) the mean and variance of particle displacement in the flow direction, and (2) the probability density function of particle coordinate. Simulation results are compared, quantitatively with presently available information. Assuming that the rms of the particle (heavy) fluctuating velocity and the Lagrangian time scale for heavy particles are equal to those for fluid particles causes an error in the horizontal component of particle step which is greater than that in the vertical component; moreover, it appears that the mean computed by the simulation is reasonably satisfactory whereas the variance is not. The numerical simulation technique presented provides simplicity, flexibility and saving in computer time; its disadvantages include its relatively approximate nature and its requirement of correct input information. **VALVE FOR CONTROLLING LIQUID DISCHARGE.**
Netherlands Patent 81931V/47. Issued November 6, 1974. Derwent Netherlands Patents Report, Vol 47, No 5, p 2, November 11, 1974.

Descriptors: *Patents, *Valves, Liquids, Waste disposal, Plastics, Construction materials, Sewage disposal.
Identifiers: Polyvinylchloride(PVC), Waste discharge, Hinges.

A patent was granted for a valve for controlling liquid discharge, with a plastic frame defining an opening, a plastic flap, and a hinge. This tide valve is to be placed on the banks of waters with a varying liquid height, and is especially useful for discharging sewage into tidal waters. It has a plastic frame, made of a substance such as polyvinylchloride, defining an opening and a plastic flap such as of asbestos-reinforced PVC, hinged for closing the opening. The flap is placed in the end of a tube piece, with the flexible plastic fastened to the frame and the flap, and is protected against damage. The hinge is thus given good protection and ensures prolonged and reliable operation. (Prague-FIRL)

**DIMENSIONING AND DESIGN OF SMALL WASTE WATER PUMPING STATIONS (BEMESSUNG UND GESTALTUNG VON KLEIN-ABWASSERPUMPWERKEN),**
F. Siefert.
Technische Mitteilungen, Vol 68, No 5, p 167-172, May, 1975. 6 fig.

Descriptors: *Pumping plants, *Design, *Pumps, Construction costs, Flood protection, Pipes.
Identifiers: Small-capacity pumping stations.

General problems of the dimensioning and design of small waste water pumping stations are described. Dry type pumps offer advantages over wet type pumps in that they facilitate cleaning due to a separated suction space. Wet type pumps require lower construction costs and less strict flood protection. Vertical pumps offer increased flood protection, while horizontal layout permits adjustment of the pump capacity to particular flow conditions. Suction and delivery pipes should have a minimum diameter of 100 mm. Delivery pipes should be made of corrosion-resistant steel with a minimum wall thickness of 6 mm. The suction space should be tiled or lined with fiber-glass-reinforced polyester to facilitate scavenging. (Takacs-FIRL)

**DESIGN CRITERIA FOR SINGLE-POINT MOORING TERMINALS,**
Shell Internationale Research Maatschappij N.V., The Hague (Netherlands).
J. M. Langeveld.
Journal of the Waterways, Harbors, and Coastal Engineering Division, Proceedings of the American Socity of Civil Engineers, Vol 100, No WW4, Proceedings paper No. 10931, p 305-323, November 1974. 9 fig, 6 ref.

Descriptors: *Harbors, *Hydrography, Environmental engineering, Buoys, Deep water, Safety, *Design criteria, Operations and maintenance, Computer models, Computer programs, Alternative planning, Sites, Coastal engineering, Operations research.
Identifiers: *Crude oil, *Offshore structures, Terminal facilities, Marine environment, Tanker ships, Moorings, Berths.

Single-point moorings have come to be accepted as a logical choice for off-shore berths for large tankers. The type most commonly used is that in which a single-mooring buoy (SBM) is anchored to the seabed with long catenaries of chain. Site selection for single-point moorings (SPM) is governed above all by safety of operation of the tanker in maneuvering and mooring. Site conditions and marine environment play a major part in judging this safety. Detailed information is required on bottom conditions, sea levels, currents, winds, waves, and visibility. In the design of a specific single-buoy mooring system, the main parameter is the mooring load. Determination of this load requires model tests, since reliable design formulas are not yet available. The Royal Dutch/Shell Group, in their world-wide operations, are successfully using their single-buoy mooring system, which is undergoing gradual improvements. SBM can be operated without causing pollution to the surrounding coastline and without detrimental effect on the local marine environment. (Bell-Cornell)

**EFFECT OF BACKFILL ON DRAIN FLOW IN LAYERED SOILS,**
California Univ., Davis.
R. B. Hwang, J. N. Luthin, and G. S. Taylor.
Journal of the Irrigation and Drainage Division, Proceedings of American Society of Civil Engineers, Vol 100, No IR3, p 267-276, September. 1974. 4 fig, 1 tab, 10 ref.

Descriptors: *Drainage practices, Drainage engineering, *Drains, *Soil profiles, Soil properties, Hydraulic conductivity, *Backfill, Compaction, *Compacted soils.

The purpose of the work is to shed some light on the transient flow towards drains in layered soils with the ultimate goal of improving the techniques of drainage design. The combination of layers occurring in the field soils is very great but experience shows that many soils can be treated as two-layered soils from a standpoint of drainage design. Trial-and-error methods in the field may well be the best way to treat some of the more complicated soil layering problems. However, for soils that can be approximated by a two-layer model the results presented herein will improve our understanding of the flow towards drains and the effect of the backfill material on such flow. **A BIBLIOGRAPHY OF BISCAYNE BAY, FLORIDA MONITORING AND RESEARCH PROGRAMS,**
Miami Univ., Fla. Sea Grant Institutional Program.
P. C. Rosendahl.
Special Report Number 2, May 1975. 82 p, 11 fig.
OSG 04-5-158-14.

Descriptors: *Data collections, Documentation, *Natural resources, Water resources, Ecosystems, Ecology, Investigations, Baseline studies, *Florida, *Bibliographies.
Identifiers: *Data monitoring programs, *Marine ecosystems, Data bases, Chemical data, Physical data, Biological data, *Biscayne Bay(FL).

Biscayne Bay is a natural resource of paramount importance to the citizens of Dade County and all of Florida. To determine the changes that have occurred to this marine ecosystem in recent time and to monitor future changes, a number of data collection programs have been conducted. This report attempts to identify data monitoring programs that have been conducted in the bay. To be included in this report, a program had to cover a broad geographical area or a time period of at least a year. Data bases should ideally have time spans of five years or more, but such a requirement would have reduced the list almost to zero. This report includes any study covering at least a Card Sound-size area of the bay, even the one-time studies. Part II also contains a literature survey for Biscayne Bay of about 900 citations. This survey should not be considered exhaustive, but should be revised as new references are discovered or new reports are written. (NOAA)

OWRT A-999-CAL(10).

Descriptors: *Scientific personnel, *Research and development, Universities, Publications, *California.
Identifiers: Directories.

The objective is to identify as nearly as possible those faculty and staff scientists in the University of California actively investigating one or more aspects of water resources problems. The Directory may be used as a means of direct contact with the investigator or as a means of identifying those who have published results of research investigations. The Water Resources Center maintains two specialized collections of published and archival research reports in which are located many of the publications and studies of scientists listed in the Directory. The primary collection is on the Berkeley Campus and the smaller, more regionally-oriented collection, is on the Los Angeles Campus. (Snyder-California, Davis)

Geochemistry and Gensis of Fluoride-ing Ground Waters in India,
W75-11645

APPALACHIAN MOUNTAIN REGION
Geohydrologic Reconnaissance of th Potomac River Basin,
W75-11493

APPLICATION METHODS
Basic Principles of Pulse Irrigation,
W75-11833

AQUACULTURE
Biological Considerations on the Use mal Effluents for Finfish Aquaculture,
W75-11759

QUATIC ANIMALS
High Copper Concentrations in Squid Livers in Association with Elevated Levels of Silver, Cadmium and Zinc,
W75-11609 5C

Rehabilitating Oiled Aquatic Birds,
W75-11616 5G

QUATIC BIRDS
Rehabilitating Oiled Aquatic Birds,
W75-11616 5G

QUATIC ENVIRONMENT
Effects of Methylmercury Chloride on Rana Pipiens Tadpoles,
W75-11527 5C

Environmental Aspects of Aquatic Plant Control,
W75-11843 5G

QUATIC PLANTS
Contribution to the Ecology of Indian Aquatics: IV. Rate of Dry Matter Production of the Leaves of Several Common Aquatic Plants of Gorakhpur (India),
W75-11386 2I

QUATIC WEED CONTROL
Environmental Aspects of Aquatic Plant Control,
W75-11843 5G

QUIFER CHARACTERISTICS
Digital-Simulation and Projection of Water-Level Declines in Basalt Aquifers of the Odessa-Lind Area, East-Central Washington,
W75-11494 2F

QUIFER RESPONSE
Well Pumping in Unconfined Aquifers: The Influence of the Unsaturated Zone,
W75-11631 4B

QUIFER SYSTEMS
dentification of Parameters in a Linear Equation of Groundwater Flow,
W75-11799 2F

QUIFERS
Response of Unconfined Aquifer Systems to Deep Percolation,
W75-11474 2F

RGENTINA (LAKE MASCARDI)
Phytoplankton in Lake Mascardi (Rio Negro, Argentina), (In Spanish),
W75-11532 5C

RID CLIMATES
Proceedings of the Water Harvesting Symposium, Phoenix, Arizona, March 26-28, 1974.
W75-11800 3B

Water Harvesting for Livestock in Western Australia,
W75-11801 3B

Engineering Aspects of Water Harvesting Research at the University of Arizona,
W75-11802 3B

Oil Treatment with Silicones for Water Harvesting,
W75-11806 3B

Performance and Durability of Sheet Metal, Butyl Rubber, Asphalt Roofing and Bentonite for Harvesting Precipitation,
W75-11808 3B

Water Harvesting Catchments on Indian Lands in the Southwest,
W75-11809 3B

Design and Construction of Roaded Catchments,
W75-11810 3B

A Computer Model for Optimizing Design of Improved Catchment,
W75-11813 3B

Sealing Leaking Excavated Tanks on Farms in Western Australia,
W75-11814 3B

Evaporation Suppression for Conserving Water Supplies,
W75-11816 3B

The Design of Roaded Catchments for Maximum Runoff,
W75-11817 3B

Crop Production by Water Harvesting,
W75-11823 3B

ARIZONA
Water Harvesting Catchments on Indian Lands in the Southwest,
W75-11809 3B

Desert Strip Farming--Computer Simulation of an Ancient Water Harvesting Technique,
W75-11812 3B

Crop Production by Water Harvesting,
W75-11823 3B

ARKANSAS
Progress Report to the Arkansas State Highway Commission for Year Ending June 30, 1975,
W75-11501 8B

ARMA PROCESSES
Models of the Stochastic and Chronologic Structure, Prediction and Simulation of Runoff Sequences - Application to the Lower Ohio Basin,
W75-11783 2E

AROMATIC COMPOUNDS
Studies of the Aromatic Compounds Content in Sea Water by Low-Temperature Luminescent Spectroscopy, (In Russian),
W75-11786 5A

ARSENIC COMPOUNDS
Lead and Arsenic Levels of Dairy Cattle in Proximity to a Copper Smelter,
W75-11544 5A

ARTIFICIAL RECHARGE
Water Quality Changes Related to the Development of Anaerobic Conditions During Artificial Recharge,
W75-11497 5B

ARTIFICIAL RECHARGES
Mathematical Models of Artificial Recharge Systems,
W75-11626 4B

ASPHALT
Performance and Durability of Sheet Metal, Butyl Rubber, Asphalt Roofing and Bentonite for Harvesting Precipitation,
W75-11808 3B

ATCHAFALAYA RIVER
An Inventory and Study of the Vermilion Bay-Atchafalaya Bay Complex; Area Description, Biology, Hydrology and Chemistry, and Sedimentology,
W75-11571 2L

ATLANTIC COASTAL PLAINS
The Ecology of the Cumberland Island National Seashore Camden County, Georgia,
W75-11546 2L

ATMOSPHERIC COMPOSITION
Atmospheric Physics and Chemistry Laboratory: Collected Reprints 1973.
W75-11552 2B

ATMOSPHERIC PHYSICS
Atmospheric Physics and Chemistry Laboratory: Collected Reprints 1973.
W75-11552 2B

ATOMIC ABSORPTION SPECTROPHOTOMETRY
Lead and Arsenic Levels of Dairy Cattle in Proximity to a Copper Smelter,
W75-11544 5A

ATOMIC ABSORPTION SPECTROSCOPY
Loss of Trace Elements from Natural Water During Storage. I. Behavior of 203 Hg and 65 Zn Added to Pond Water,
W75-11543 5A

The Behaviour of Metal Tetramethylenedithiocarbamates in the Graphite-Tube Furnace for Atomic Absorption Spectrometry,
W75-11797 5A

ATROZINE
Utilization of Water in a Semi-Arid Region,
W75-11356 3F

AUSTRALIA
Sidrotherm Desalination,
W75-11707 5D

Water Harvesting for Livestock in Western Australia,
W75-11801 3B

Bitumen, Oil, and Clay Surfaces on a Deep Sand to Increase Runoff from Catchments for Excavated Tanks in Western Australia,
W75-11805 3B

Design and Construction of Roaded Catchments,
W75-11810 3B

A Computer Model for Optimizing Design of Improved Catchment,
W75-11813 3B

Sealing Leaking Excavated Tanks on Farms in Western Australia,
W75-11814 3B

AUTOMATION
Continuous Monitoring, Automated Analysis and Sampling Procedures, (Literature Review),
W75-11711 5A

AXISYMMETRIC FLOW
Axisymmetric Seepage Flow Through Semi-Infinite Porous Media,
W75-11633 2F

BACKFILL
Effect of Backfill on Drain Flow in Layered Soils,
W75-11834 8D

BACTERIA
Is the Malachite Green Broth According to Habs and Kirchner Suitable for Serving as an Isolation Medium for Pseudomonas Aeruginosa from Water, (In German),
W75-11435 5B

BALANCE OF NATURE
The Ecology of the Cumberland Island National Seashore Camden County, Georgia,
W75-11546 2L

BALANCING RESERVOIRS
Balancing Reservoir--A Key Element in Water Supply Plan,
W75-11687 4A

BARLEY
Water Harvesting for Barley in a 30-CM Winter Rainfall Area,
W75-11825 3B

BARNACLES
Barnacles: Possible Indicators of Zinc Pollution,
W75-11611 5B

BASALTS
Digital-Simulation and Projection of Water-Level Declines in Basalt Aquifers of the Odessa-Lind Area, East-Central Washington,
W75-11494 2F

BASELINE STUDIES
Mercury Levels in Fish in the La Grande River Area, Northern Quebec,
W75-11756 5A

BASIC DATA COLLECTION
Surface Water Supply of the United States, 1966-70: Part 13. Snake River Basin.
W75-11491 7C

BASIC DATA COLLECTIONS
Surface Water Supply of the United States, 1966-70: Part 6. Missouri River Basin--Volume 3, Missouri River Basin from Sioux City, Iowa, to Nebraska City, Nebraska.
W75-11486 7C

Surface Water Supply of the United States, 1966-70: Part 8. Western Gulf of Mexico Basins--Volume 2. Basins from Lavaca River to Rio Grande.
W75-11487 7C

Surface Water Supply of the United States, 1966-70: Part 9. Colorado River Basin--Volume 3. Lower Colorado River Basin.
W75-11488 7C

Surface Water Supply of the United States, 1966-70: Part 10. The Great Basin.
W75-11489 7C

Surface Water Supply of the United States, 1966-70: Part 12. Pacific Slope Basins in Washington--Volume 1. Pacific slope Basins in Washington Except Columbia River Basin.
W75-11490 7C

Ground-Water Data for Bolivar County, Mississippi,
W75-11496 7C

Ground-Water Data in the Harrisburg - Halsey Area, Central Willamette Valley, Oregon,
W75-11498 7C

BAST
Sanitary and Bacteriological Evaluation of the Raw Material, Air and Wastewaters of Some Bast Fiber Plants in the Uzbek SSR, (In Russian),
W75-11406 5B

BAY MUSSELS
Hydrocarbons Associated with Suspended Particulate Matter in San Francisco Bay Waters,
W75-11614 5A

BEAR CREEK (CALIF)
Flood Plain Information: Northeast Stream Group, Stockton, California.
W75-11789 4A

BEAUFORT COUNTY (SC)
Land Use and Environmental Planning: An Application in the South Carolina Coastal Zone,
W75-11766 6G

BED FORMS
Resistance to Flow in Alluvial Channels,
W75-11459 2E

BEDROCK
Improved Application of Geophysics to Groundwater Resource Inventories in Glaciated Terrains,
W75-11355 2F

BENCH LEVELING
Runoff Utilization for Grain Production,
W75-11824 3B

BENTHIC FAUNA
Oligochaetes in the Bottom Fauna and Stomach Content of Trout, Salmo Trutta (L.),
W75-11385 2H

Shell Disease in Crabs and Lobsters from New York Bight,
W75-11606 5C

BENTHOS
Hydrochemical and Hydrobiological Peculiarities of Limans in the Danube-Dniester Interfluve, (In Ukrainian),
W75-11847 2K

BENTONITE
Performance and Durability of Sheet Metal, Butyl Rubber, Asphalt Roofing and Bentonite for Harvesting Precipitation,
W75-11808 3B

BIBLIOGRAPHIES
Plating and Cyanide Wastes, (Literature Review),
W75-11370 5D

A Bibliography of Biscayne Bay, Florida Monitoring and Research Programs,
W75-11557 10C

Ocean Engineering--Selected References,
W75-11779 8B

BILIARY EXCRETION
Biliary Excretion of Phenyl and Methyl Mercury Chlorides and Their Enterohepatic Circulation in Rats,
W75-11525 5C

BIOACCUMULATION
Organochlorine Compounds in Several Marine Organisms from the North Sea and the Dutch Wadden Sea,

Copper and Zinc in Cancer Irroratus: Comparative Metabolism of the Molt Cycle. le Cuivre le Zinc Chez Cancer Irroratus (Crustace:Decapode): Metabolisme Comparé au Cours du Cycle D'intermue.
W75-11752

The Behaviour of Tetramethylenedithiocarbamates in the Graphite-Tube Furnace for Atomic Absorption Spectrometry.
W75-11797

The Determination of Cadmium in Sea Water by Radioactivation.
W75-11798

HERBICIDES

Further Observations on the Effect of Sodium Salt of 2,4-D on Early Developmental Stages of Carp (Cyprinus Carpio L.).
W75-11762

Environmental Aspects of Aquatic Plant Control.
W75-11843

HISTORIC FLOODS

Flood Plain Information: Flood Hazard Data of 4-7 July 1969 Flood, Huron River, Norton Creek, Ohio.
W75-11787

ISTORY
Water Development in Management of Livestock and Wildlife on Mountain Wildlands.
W75-11804 3B

UMAN INFECTIONS (INTESTINAL)
Evaluation of the Quality of Surface Water for Developing Recommendations of Nonspecific Prophylaxis of Intestinal Infections. (In Russian).
W75-11512 5C

URON RIVER (OHIO)
Flood Plain Information: Flood Hazard Report of 4-7 July 1969 Flood, Huron River, Norwalk Creek, Ohio.
W75-11787 4A

URRICANE FACTORS
Some Climatological Characteristics of Hurricanes and Tropical Storms, Gulf and East Coasts of the United States.
W75-11556 2B

URRICANE LEVELS
Hurricane Experience Levels of Coastal County Populations - Texas to Maine.
W75-11570 2B

URRICANE ORIGIN
Further Studies on the Origin of Hurricanes.
W75-11559 2B

URRICANE SCALES
Hurricane Experience Levels of Coastal County Populations - Texas to Maine.
W75-11570 2B

URRICANES
Some Climatological Characteristics of Hurricanes and Tropical Storms, Gulf and East Coasts of the United States.
W75-11556 2B

Further Studies on the Origin of Hurricanes.
W75-11559 2B

Hurricane Experience Levels of Coastal County Populations - Texas to Maine.
W75-11570 2B

Central North Pacific Tropical Cyclones, 1974.
W75-11579 2B

YDRAULIC CONDUCTIVITY
Unsaturated Hydraulic Conductivity from Cumulative Inflow Data.
W75-11593 2G

YDRAULIC LOADING
Suspended Solids Removal Processes Studied in Metro Chicago.
W75-11741 5D

YDRAULIC MODELS
Hydraulic Model Studies of a Second Powerhouse at Rock Island Hydroelectric Project.
W75-11466 8B

Hydraulic Model Studies of a Second Powerhouse at Rock Island Hydroelectric Project, Cofferdam Tests.
W75-11467 8B

Scale Effects on Cooling Tower Model Studies.
W75-11470 8B

Hydraulic Design of Vertical Stilling Wells.
W75-11650 8B

YDRAULIC STRUCTURES
Hydraulic Model Studies of a Second Powerhouse at Rock Island Hydroelectric Project.
W75-11466 8B

Hydraulic Model Studies of a Second Powerhouse at Rock Island Hydroelectric Project, Cofferdam Tests.
W75-11467 8B

HYDRAULICS
Cavitation in Butterfly Valves.
W75-11777 8B

Energy Losses at 90 Degrees Pipe Junctions.
W75-11778 8B

Friction--Frequency Dependence for Oscillatory Flows in Circular Pipe.
W75-11780 8B

Simulation of Dispersion of Suspended Particles.
W75-11782 8B

HYDROBIOLOGY
Hydrochemical and Hydrobiological Peculiarities of Limans in the Danube-Dniester Interfluve. (In Ukrainian).
W75-11847 2K

HYDROCHEMICAL CONDITIONS
Hydrochemical and Hydrobiological Peculiarities of Limans in the Danube-Dniester Interfluve. (In Ukrainian).
W75-11847 2K

HYDROGEN ION CONCENTRATION
An Ecological Survey of the Rocky Coast Adjacent to a Bromine Extraction Works.
W75-11758 5C

HYDROGEN PEROXIDE
Sewage Treatment with Hydrogen Peroxide
W75-11443 5D

HYDROGEOLOGY
Regional Chemistry of Groundwater in the Wainwright Area, Alberta.
W75-11471 2F

Hydrogeology of the Wainwright Area, Alberta.
W75-11475 4B

Geohydrologic Reconnaissance of the Upper Potomac River Basin.
W75-11493 2F

A Topographic-Hydrogeologic Model for Solid Waste Landfill Siting.
W75-11644 5B

HYDROGRAPH ANALYSIS
Prediction of Flood Volume from Small Humic Region Watersheds.
W75-11462 4A

HYDROGRAPHS
Soil Moisture Accounting Component of the USDAHL-74 Model of Watershed Hydrology.
W75-11656 2G

HYDROGRAPHY
Sources of Water Quality, Lake Level, Ice, Water Temperature and Meteorological Data for the St. Lawrence Great Lakes.
W75-11567 2H

Design Criteria for Single-Point Mooring Terminals.
W75-11771 8C

HYDROLOGIC CYCLE
Man on the Hydrologic Cycle.
W75-11776 2A

HYDROLOGIC DATA
Ground-Water Data for Bolivar County, Mississippi.
W75-11496 7C

Data Requirements for the Optimization of Reservoir Design and Operating Rule Determination.
W75-11500 4A

Progress Report to the Arkansas State Highway Commission for Year Ending June 30, 1975.
W75-11501 8B

Low-Flow Characteristics of Streams in the Grays Harbor Drainages, Washington.
W75-11502 2E

Sources of Water Quality, Lake Level, Ice, Water Temperature and Meteorological Data for the St. Lawrence Great Lakes.
W75-11567 2H

Soil Moisture Accounting Component of the USDAHL-74 Model of Watershed Hydrology.
W75-11656 2G

Identification of Parameters in a Linear Equation of Groundwater Flow.
W75-11769 2F

HYMO COMPUTER PROGRAM
Hymo Flood Routing.
W75-11647 4A

ICE CHARTS
Great Lakes Ice Cover, Winter 1973-74.
W75-11572 2C

ICE COVER
Great Lakes Ice Cover, Winter 1973-74.
W75-11572 2C

ICE FLOES
Great Lakes Ice Cover, Winter 1973-74.
W75-11572 2C

ICED LAKES
Great Lakes Ice Cover, Winter 1973-74.
W75-11572 2C

IDAHO
Comparison of Precipitation Gage Catches with a Modified Alter and a Rigid Alter Type Windshield.
W75-11457 2B

ILLINOIS
Mercer County Surface Water Resources.
W75-11622 4A

Vermilion County Surface Water Resources.
W75-11623 4A

Lawrence County Surface Water Resources.
W75-11624 4A

De Kalb County Surface Water Resources.
W75-11625 4A

Metro Chicago Studies on Nitrification.
W75-11742 5D

IMMATURE GROWTH STAGE
Effects of Methylmercury Chloride on Rana Pipiens Tadpoles.
W75-11527 5C

IMPOUNDMENTS
An Economic and Environmental Reconnaissance of the Possibilities for Small Watershed Development in Chenango County.
W75-11796 4D

INCINERATION
Incinerator Device and a Method of Processing Residuals in Waste Water, Liquefied Sewage and Sludge,
W75-11440 5D

Recycling of Incinerator Ash,
W75-11714 5D

Aspects of Incinerating Chemical Sludges,
W75-11728 5D

INDIA
Geochemistry and Gensis of Fluoride-Containing Ground Waters in India,
W75-11645 2K

INDIA (GORAKHPUR)
Contribution to the Ecology of Indian Aquatics: IV. Rate of Dry Matter Production of the Leaves of Several Common Aquatic Plants of Gorakhpur (India),
W75-11386 2I

INDIANA
Comparative Analysis of Estimation Methods in Nonlinear Functional Models of the Rainfall-Runoff Process,
W75-11354 2A

Improved Application of Geophysics to Groundwater Resource Inventories in Glaciated Terrains,
W75-11355 2F

INDUCED POLARIZATION
Improved Application of Geophysics to Groundwater Resource Inventories in Glaciated Terrains,
W75-11355 2F

INDUSTRIAL PLANTS
Report of Analyses for Industrial Waste Water in Twenty-Eight Factories, (In Japanese),
W75-11671 5A

INDUSTRIAL WASTES
Methods and Equipment for the Treatment of Spent Oil Emulsions (Verfahren und Anlagen zur Behandlung Verbrauchter Oel-Emulsionen),
W75-11359 5D

Separation of Emulsified Oil from Water,
W75-11360 5D

Optimum Design of Sour Water Strippers,
W75-11361 5D

Sequential Treatment of Kraft Pulp Washing Wastewater by Pilot Plant-Activated Sludge Treatment, Lime Treatment and Activated Carbon Treatment, (In Japanese),
W75-11362 5D

Float-Wash Fractionator Saves Fibre and Water at Grand'Mere,
W75-11363 5D

New Effluent Treatment Plant Opened at Bristol for Board Mills.
W75-11364 5D

Land Spreading Effluent from a Secondary Facility,
W75-11365 5D

City, Industry Face Pollution Abatement Together,
W75-11366 5D

Method for Reclaiming Industrial Wastes and Eliminating Pollution,
W75-11367 5D

Watch That Water,
W75-11368 5D

Dehydrating Industrial Sludges by Filtration
W75-11369 5D

Plating and Cyanide Wastes, (Literature Review),
W75-11370 5D

Acceleration of Biochemical Treatment of Wastewater in Petroleum Refineries,
W75-11371 5D

Advanced Treatment of Waste Water from Machinery Works by Activated Carbon (Kasseitan ni yoru kikai kojo haisui no kodo shori),
W75-11372 5D

Studies on Recovery of Chemicals and Manufacture of Activated Substances from Pulping Waste Liquor, Part 2, Use of Softwood KP-Waste Liquor, (In Japanese),
W75-11373 5D

Treatment of Waste Water from Textile Dyeing Process (Senshoku haisui shori),
W75-11374 5D

Reduced Cost Flocculation of a Textile Dyeing Wastewater,
W75-11375 5D

Studies on the Treatment of Wastewaters from the Towel Dyeing Industry,
W75-11376 5D

Treatment and Disposal of Anodizing Effluents, Part I,
W75-11377 5D

Treatment and Disposal of Anodizing Effluents, Part II,
W75-11378 5D

Biological Purification of Town and Industrial Effluents.
W75-11429 5D

Subsurface Waste Injection in the United States: Fifteen Case Histories,
W75-11627 5D

Report of Analyses for Industrial Waste Water in Twenty-Eight Factories, (In Japanese),
W75-11671 5A

A Survey of the Tokyo Metropolitan Shin-Kashi Treatment Plant, (Tokyo-to Shinkashi shorijo no gaiyo),
W75-11743 5D

INFILTRATION
Infiltration and Runoff for Small Field Plots Under Constant Intensity Rainfall,
W75-11458 3B

Simulation of Miscible Displacement in Soils,
W75-11590 2F

Unsaturated Hydraulic Conductivity from Cumulative Inflow Data,
W75-11593 2G

Two-Dimensional Similarity Solution: Theory and Application to the Determination of Soil-Water Diffusivity,
W75-11640 2G

INFILTRATION RATES
Two-Dimensional Similarity Solution Theory and Application to the Determination of Soil-Water Diffusivity,
W75-11640 2G

INFLEXTION POINTS (MATHEMATICS)
Influence of Current on Statistical Properties of Waves,
W75-11772 2L

INFORMATION RETRIEVAL
Ocean Engineering--Selected References.
W75-11779 8B

INJECTION WELLS
Subsurface Waste Injection in the United States: Fifteen Case Histories,
W75-11627 5D

INLETS (WATERWAYS)
Closure Conditions Mouth of the Russian River,
W75-11454 2L

INORGANIC MERCURY CYCLING
Mercury Cycling in a Small Hawaiian Estuary,
W75-11563 5C

INSTRUMENTATION
Instrumental Investigation of Biological Waste Water Treatment (A szennyvisek biologiai tisztitasanak muszeres vizsgalata),
W75-11407 5D

Current Measurements Using a Tilting Spar,
W75-11564 7B

Tracing Ocean Currents,
W75-11574 2E

Field Test of Soil Water Flux Meters,
